## DESCRIPTION

The Mitsubishi M5M27C100K, JK is a high-speed 1048576-bit ultraviolet erasable and electrically reprogrammable read only memory. It is suitable for microprocessor programming applications where rapid turn-around is required. The M5M27C100K, JK is fabricated by N-channel double polysilicon gate for Memory and CMOS technology for peripheral circuits, and is available in DIP/CLCC with a transparent lid.

## FEATURES

- 131072 word x 8 bit organization
- Access time M5M27C100K-12, JK-12 . . . 120ns (max.)  
M5M27C100K-15, JK-15 . . . 150ns (max.)  
M5M27C100K-2, JK-2 . . . . . 200ns (max.)  
M5M27C100K . . . . . 250ns (max.)
- Two line control  $\overline{OE}$ ,  $\overline{CE}$
- Low power current ( $I_{CC}$ ): Active . . . . . 50mA (max.)  
Stand by . . . . . 1mA (max.)
- Single 5V power supply
- Programming voltage . . . . . 12.5V
- 3-State output buffer
- Input and output TTL-compatible in read and program mode
- Pin compatible with 1Mbit MASK ROM (DIP)
- Byte programming algorithm
- Page programming algorithm

## APPLICATION

Microcomputer systems and peripheral equipment

## FUNCTION

### Read

Set the  $\overline{CE}$  and  $\overline{OE}$  terminals to the read mode (low level). Low level input to  $\overline{CE}$  and  $\overline{OE}$  and address signals to the address inputs ( $A_0 \sim A_{16}$ ) make the data contents of the designated address location available at the data input/output ( $D_0 \sim D_7$ ). When the  $\overline{CE}$  or  $\overline{OE}$  signal is high, data input/output are in a floating state.

When the  $\overline{CE}$  signal is high, the device is in the standby mode or power-down mode.

## Programming

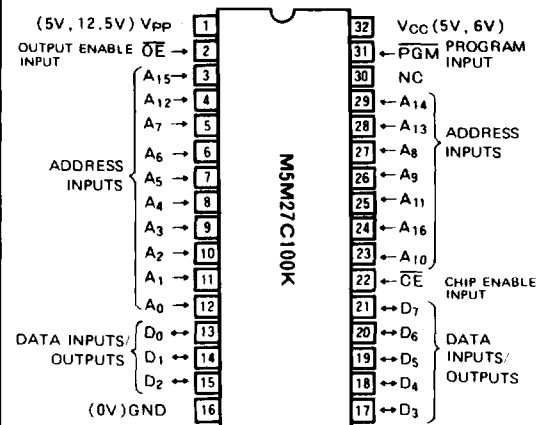

### (Byte programming algorithm)

The M5M27C100K, JK enters the byte programming mode when 12.5V is supplied to the  $V_{PP}$  power supply input,  $\overline{CE}$  is at low level and  $\overline{OE}$  is at high level. A location is designated by address signals ( $A_0 \sim A_{16}$ ), and the data to be programmed must be applied at 8-bits in parallel to the data inputs ( $D_0 \sim D_7$ ). In this state, byte programming is completed when PGM is at low level.

### (Page programming algorithm)

Page programming feature of the M5M27C100K, JK allows 4 bytes of data to be simultaneously programmed. The

destination addresses for a page programming operation must reside on the same page; that is,  $A_2$  through  $A_{16}$  must not change. At first, the M5M27C100K, JK enters the page data latch mode when  $V_{PP} = 12.5V$ ,  $\overline{CE} = "H"$ ,  $\overline{OE} = "L"$  and  $\overline{PGM} = "H"$ . The four locations in same page are designated by address signals ( $A_0, A_1$  change), and the data to be programmed must be applied to each location at 8-bits in parallel to the data inputs ( $D_0 \sim D_7$ ). In this state, the data (4-bytes) latch is completed. Then the M5M27C100K, JK enters the page programming mode when  $\overline{OE} = "H"$ . In this state, page (4-bytes) programming is completed when  $\overline{PGM} = "L"$ .

**Erase**

Erase is effected by exposure to ultraviolet light with a wavelength of 2537Å at an intensity of approximately 15WS/cm<sup>2</sup>. Sunlight and fluorescent light may contain ultraviolet light sufficient to erase the programmed information. For any operation in the read mode, the transparent lid should be covered with opaque tape.

## PROGRAM OPERATION

### BYTE PROGRAMMING ALGORITHM

First set V<sub>CC</sub> = 6V, V<sub>PP</sub> = 12.5V and then set an address to first address to be programmed. After applying 0.2 ms program pulse (PGM) to the address, verify is performed. If the output data of that address is not verified correctly, apply one more 0.2 ms program pulse. The programmer continues 0.2 ms pulse-then-verify routines until the device verify correctly or twenty five of these pulse-then-verify routines have been completed. The programmer also

maintains its total number of 0.2 ms pulse applied to that address in register X. And then applied a program pulse X times of 0.2 ms width as an overprogram pulse. When the programming procedure above is finished, step to the next address and repeat this procedure till last address to be programmed. When the entire addresses have been programmed completely, all addresses should be verified with V<sub>CC</sub> = V<sub>PP</sub> = 5V.
