Blueprint

IMPORTANT NOTE

DO NOT plug in your new game yet. Before you do anything to your game, we recommend that you read SECTIONS I and II of this manual completely. It will not take more than a few minutes and it may be very helpful.

I. Introduction

BLUEPRINT is a one or a two player game. There are three models: the "UPRIGHT", "MINI", and "COCKTAIL TABLE". When the two player mode is selected on the Upright or Mini model, the players take turns at the controls to guide J.J. through the game course. If you have purchased the Cocktail Table model of this game, the rules of play are the same. The only difference is that in the two player mode of the Cocktail Table game, the picture flips to face you when it's your turn.

When playing this game, you must direct J.J. through the maze he is in. This is done with the control stick. J.J. is searching for the parts to build the Ammo Machine on the BLUEPRINT at the bottom of the screen which will enable him to save his girl friend from the ogre that is chasing her across the top of the screen.

Each part of this Ammo Machine is contained in one of the houses in the maze. Two of the houses contain bombs. Also, any house that J.J. has removed a part of the Ammo Machine from will contain a bomb if he goes back into it for any reason.

If J.J. goes into a house and comes out with a part for the Ammo Machine, he must tow it down to the BLUEPRINT and place this part over the corre-

sponding section of the BLUEPRINT. This done, he can head back into the maze and go looking for another part to the Ammo Machine.

If J.J. goes into a house and comes out with a bomb, he must make his way to the Bomb Pit located at the lower right hand corner of the screen and throw it in BEFORE it goes off. If he fails, you lose one man.

Once the Ammo Machine is built, J.J. must push the Start Button for it located at the lower left hand corner of the screen. Once this is done, the Ammo Machine will start firing at the ogre chasing J.J.'s girl friend across the top of the screen. You can move the Ammo Machine back and forth across the bottom of the screen at this time with the control stick. It does not move up and down on the screen.

As your skill level increases, the ogre runs faster, the bomb fuses are shorter, a maze monster will appear (which can cause you to lose one man if you touch him), and so on. In general, each maze will be harder to complete than the one before.

A bonus man is awarded to you as you reach or pass a certain preselected point value. Each part of the Ammo Machine, the bombs, etc., have an assigned point value as listed in Figure 1-1.

Game Objective

The object of the game is to **HAVE FUN** and survive as long as possible while constantly improving your skills and destroying as many of the ogres as you can. As you do this, each succeeding rack will be harder to complete.

| OBJECT DESCRIPTION | POINT VALUE |
|--|----------------------------|
| EACH PART OF AMMO MACHINE | 1000 POINTS |
| BOMB | 50 POINTS |
| WEIRD WILLIE (BACK TO BOMB DISPOSAL PIT) | 100 POINTS |
| OGRE | VARIABLE 25 TO 1000 POINTS |

Figure 1-1 Assigned Point Values

II. Location and Setup

INSPECTION:

1. Remove the game from its shipping crate.
2. Inspect the entire outside of it for any signs of damage.
 - Any scratches?, dents?, cracks?
 - Any broken controls?
 - Any broken glass or plastic?
 - Just look it over closely and make a note of any signs of damage.
3. Remove the shipping cleats from the bottom of the cabinet.
4. Install the four levelers, one at each corner of the cabinet.
 - Level the cabinet.
5. Open the cabinet and inspect the inside of the game for any signs of damage. See Figure 2-1.
 - Also check to make sure all plug-in connectors on the wire harness are firmly seated.

NOTE: ALL connectors or plugs are keyed so they will only go together when all pins are properly lined up.

 - Replug any connectors found unplugged. DO NOT FORCE PLUGS ONTO CONNECTORS. DO NOT FORCE PLUGS TOGETHER. If it won't go on easily, assuming the keys are lined up, it either does not belong there or is damaged.
 - Make sure all printed circuit boards (P.C.B.'s) are firmly seated in their connectors. These connectors are also keyed. The P.C.B.'s will only go into them one way without being damaged.
 - Note the location of the game's serial number. See Figure 2-1.
 - Check all major subassemblies to be sure they are mounted securely. These are called out in Figures 2-1 & 2-2.
 - Power supply.
 - Control panel(s).
 - T.V. monitor.
 - Other P.C.B.'s and/or P.C.B. rack, etc.
 - Power supply filter assembly.
 - Transformer board assembly.
6. Make a note of any problems that can't be easily corrected.
7. Call your distributor and/or service man about your problem list.

INSTALLATION:

1. Location requirements:

Power:

Domestic 110 V @ 60 Hz

Foreign 200 V to 240 V @ 50 Hz

Temperature: 32° to 100° F (0° to 38° C)

Humidity: Not over 95% relative

Space required:

Upright 25" x 35" (63cm x 88cm)

Mini 20" x 24" (50cm x 60cm)

Cocktail 32" x 22" (81cm x 55cm)

Game height:

Upright 68" (170cm)

Mini 61" (153cm)

Cocktail 29" (73cm)

2. Voltage Selection:

Your game is designed to work properly on the line voltage where you are located. Check your line voltage with a meter to determine what its value is. Then check the power input wires to the main power supply transformer on your game to be sure they are connected to taps which correspond to your line voltage value.

If the power input wires to the main power supply transformer are not connected to taps which correspond to your local line voltage, move them to the proper taps.

If the line voltage in your area falls outside the upper or lower limits of the range of inputs covered by the main power supply transformer, **DO NOT PLUG YOUR GAME IN** until you have talked with your distributor and/or service man and obtained a solution to this problem. Otherwise you could damage your game.

3. Interlock and power ON/OFF switches. See Figure 2-1.

- To help prevent the possibility of getting an electric shock while working inside the game cabinet, interlock switches have been installed at each cabinet access door (this **DOES NOT** include the coin door in the Upright and Mini models).
- When any access door is opened, the interlock switch installed there turns off all power to the game.
- Check each interlock switch for proper operation.

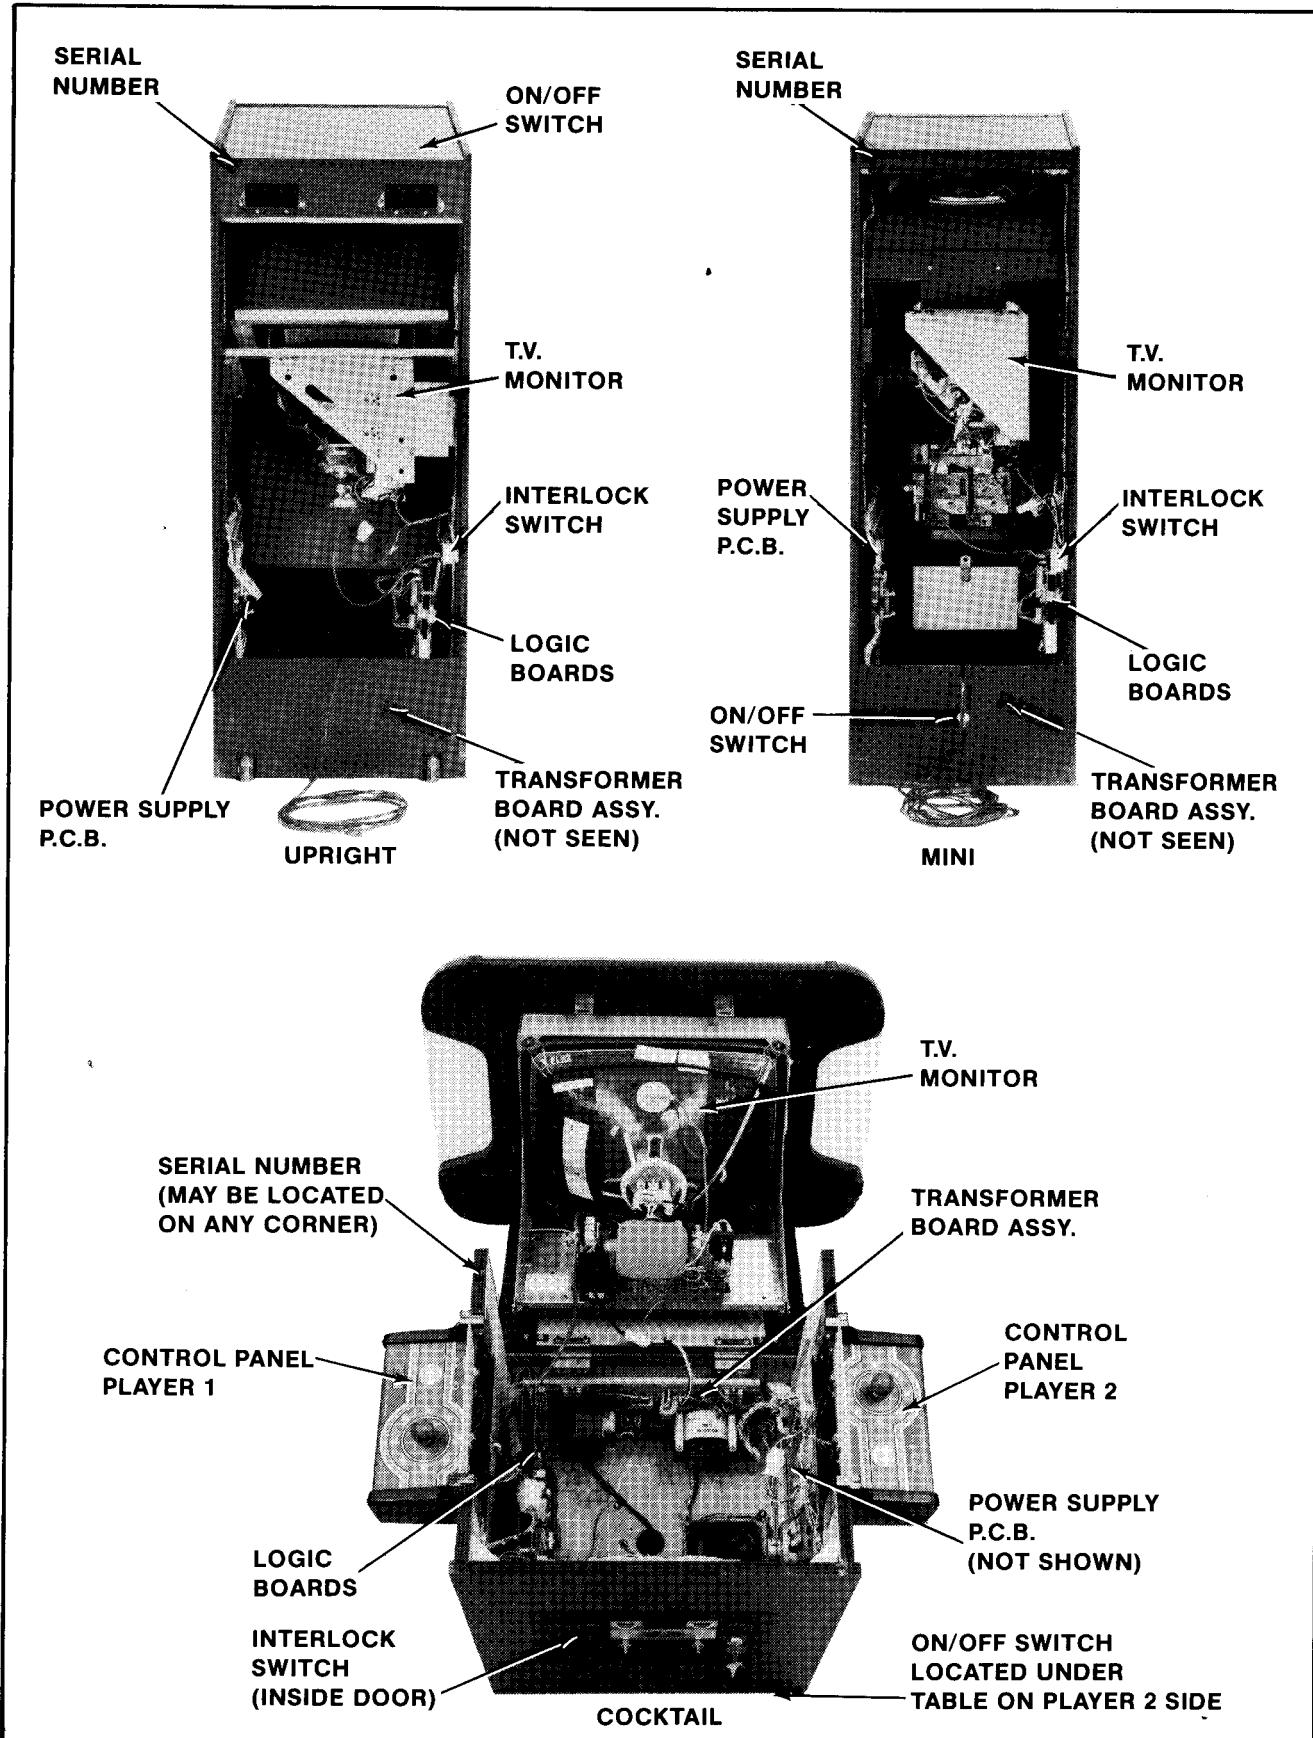

Figure 2-1 Location of Serial No., Interlock Switch, On/Off Switch, & Major Sub-Assemblies

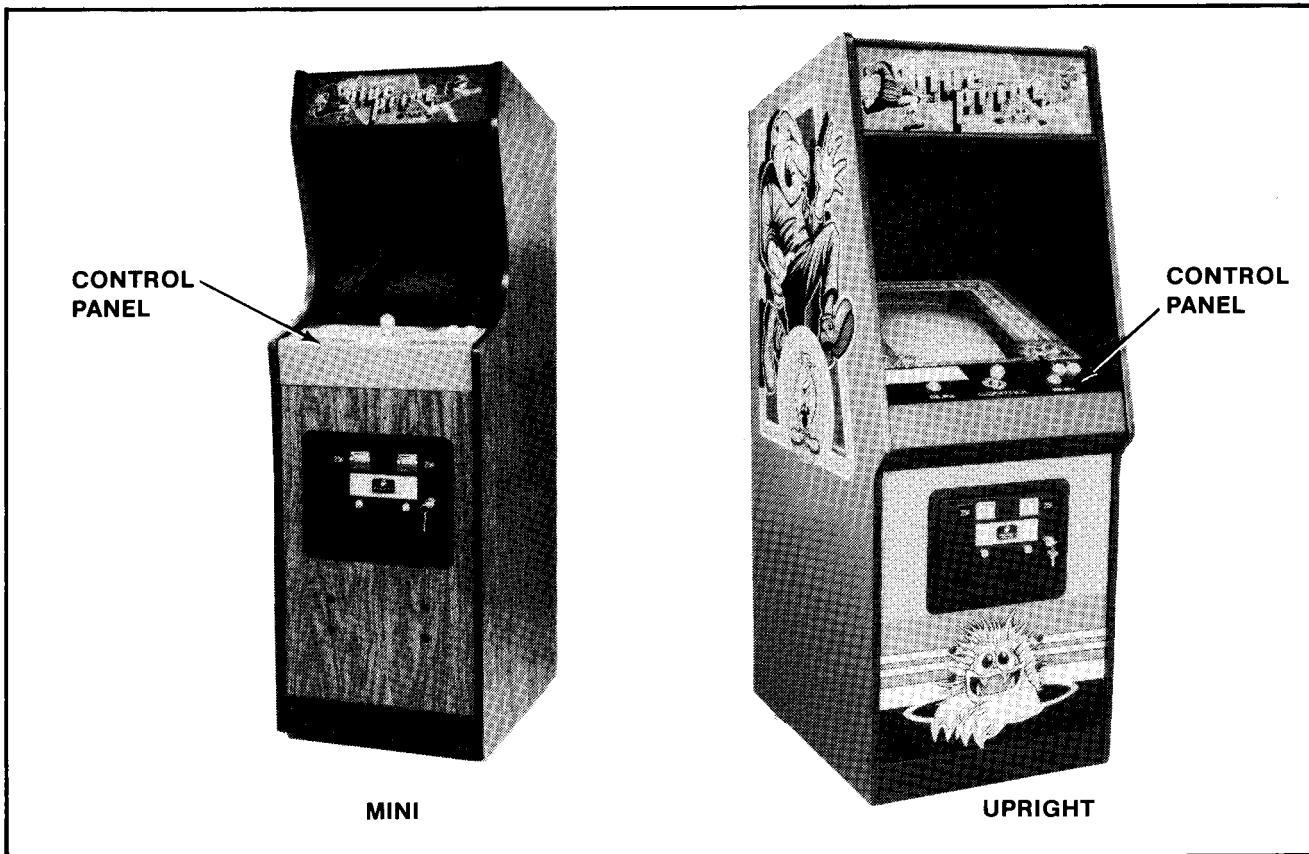

Figure 2-2 Major Sub-Assemblies (Cont. from Fig. 2-1)

After checking the line voltage in your area and determining that the input wires to the main power supply transformer of your game are connected properly — or — after obtaining a solution to your over or under voltage problem from your distributor and/or your service man, plug the game into your A.C. wall outlet.

The game ON/OFF switches for all models are located as shown in Figure 2-1. Turn the game on and allow it to warm up a few minutes.

Slowly open each access door to the game (this **does not** include the coin door on the Upright and Mini models).

As the door is opened approximately 1" (2.54cm) the power to the game should go off (the T.V. monitor, all the lights, and all sounds will stop).

If this does not happen, check the interlock switch by this door to see if it has broken loose from its mounting or if it is stuck in the "ON" position.

If the switch is found to be bad, turn the game off, unplug it, and replace the interlock switch.

When done, plug the game back into the wall outlet, close the access door, and turn the game back on.

After the game has warmed up, repeat the above interlock switch test.

When the interlock switch is working properly and turns the power to the game off, power may be restored to the game with the access door(s) open. Take hold of the interlock switch plunger and **gently** pull it out to its fully extended position. **THIS IS TO BE USED ONLY FOR SERVICING THE GAME.** See Figure 2-3.

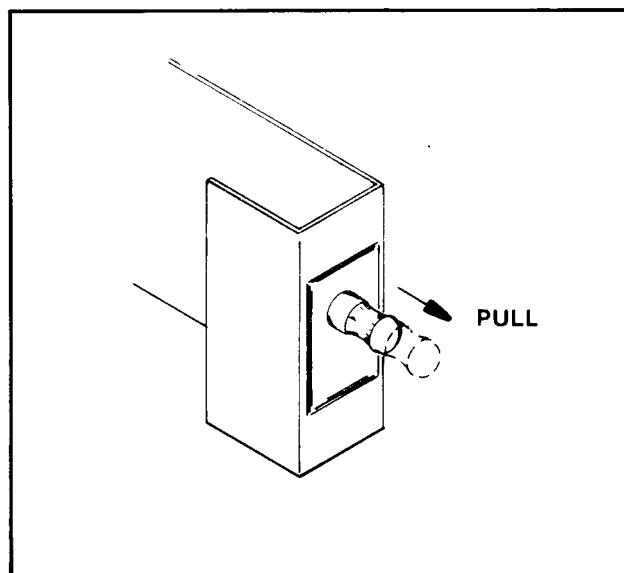

Figure 2-3 Interlock Switch Operation

SELF-TEST:

Your new game will Self-Test itself to see if it has any bad parts. The information it receives while testing itself will be shown on the T.V. monitor. See the GAME OPERATION section for a more detailed description of this function.

When there is a bad result according to the Self-Test, call your distributor and/or service man to have the trouble fixed unless it is something you can do yourself (such as replace a bad RAM or ROM chip).

GAME VOLUME ADJUSTMENT CONTROL:

See Figure 2-4.

The game volume control pots (MASTER VOLUME and BACKGROUND VOLUME) are located on the MPU/SOUND board. The other board is the VIDEO board. There are two pots. For adjustment, they may be reached through the rear access door on the UPRIGHT and MINI models. On the COCKTAIL TABLE models, you will have to open the table top to reach them.

To make the sounds louder, turn the pots clockwise as you face them (↗).

To make the sounds **less** loud, turn the pots counter-clockwise as you face them (↖).

OPTION SWITCH SETTINGS:

To change the option switch settings, you **DO NOT** have to take the MPU board out of the game. They can be easily reached through the rear access door on the Upright and Mini models. On the Cocktail Table model, you do have to open the table top to reach them.

When changing any options, **ALWAYS** put the game into the Self-Test mode, make your changes, check the results on the monitor screen, take the game out of the Self-Test mode, and play the game to be sure the switches have worked properly and that no switches were accidentally moved that were not meant to be. (These switches are small and this can happen.)

The option switch settings and what they will make the game do are shown in Figure 2-5. See Figure 2-4 for option switch locations.

III. Game Operation

BLUEPRINT is a one or a two player game with a color T.V. monitor. The game gives a display which has all the parts shown in Figure 3-1.

The game has five possible modes of operation: ATTRACT, READY-TO-PLAY, PLAY, HIGH SCORE/INITIAL, and SELF-TEST.

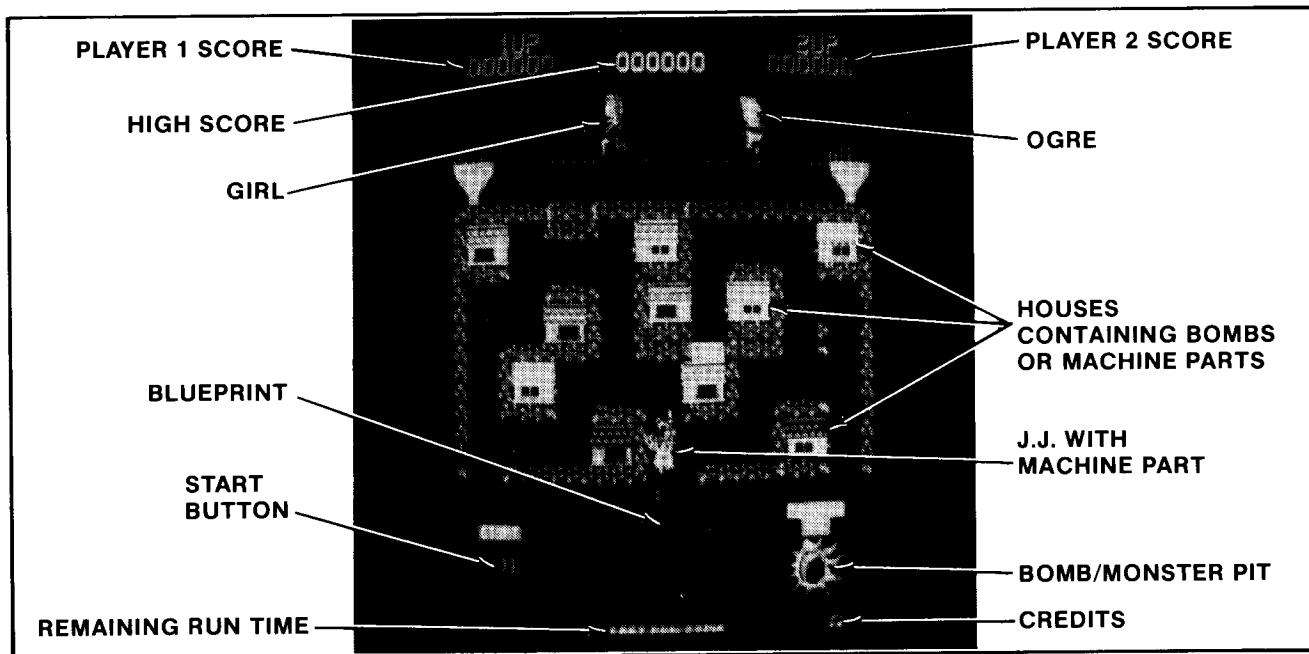

Figure 3-1 Identification of "On Screen" Graphics During Play

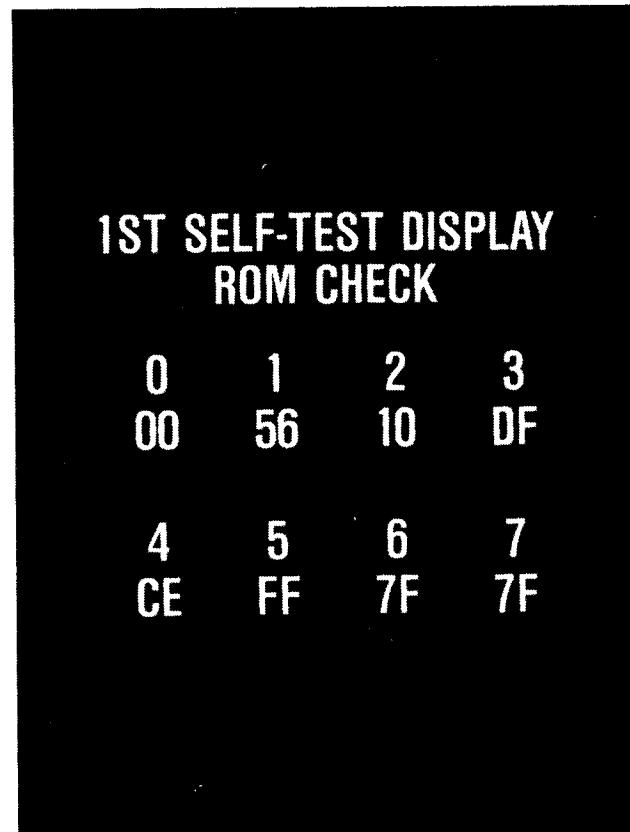

SELF-TEST MODE

The Self-Test mode is a special mode for checking game switches and computer functions. It is the easiest and best way to check for proper operation of the entire game.

NOTE: Putting the game into Self-Test will cause it to **erase** any CREDITS shown at the lower right corner of the screen from its memory.

You may begin a Self-Test at any time by sliding the Self-Test switch to the "ON" position. Next, turn the power to the game "OFF" and then back "ON" again. Now that the game is in the Self-Test mode, it will react as follows:

1. You will see two rows of numbers displayed on the monitor screen. Zero through three in the top row and four through seven in the bottom row. These numbers are in a white color. Directly below each of the white numbers is a pair of yellow numbers or letters and numbers together. The correct presentation for each of the tests (0 through 7) is given at the right.
2. If you see any presentation other than this exact one, something in your game is not functioning correctly. **THE READINGS UNDER POSITIONS 5, 6 AND 7** can be disregarded because there is no ROM installed at these P.C. Board locations.

The table that follows shows the P.C. Board locations of all positions (0 through 7) given previously.

| DESIGNATION | M.P.U. P.C.B. LOCATION | DESIGNATION | M.P.U. P.C.B. LOCATION |
|-------------|------------------------|-------------|------------------------|
| 0 | 1M | 4 | 1S |
| 1 | 1N | 5 | NOT USED |
| 2 | 1P | 6 | NOT USED |
| 3 | 1R | 7 | NOT USED |

3. By pressing the 1 and 2 PLAYER BUTTONS at the same time, the game will go to the switch check portion of the Self-Test mode. When this is done, you should see a display which looks like the following.

| 2ND SELF-TEST DISPLAY | | | | | | | |
|-----------------------|---|---|---|---|---|---|---|
| PORT 0-BIT 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| PORT 1-BIT 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| | 1 | 1 | 0 | 1 | 1 | 1 | 1 |
| DILSW1 | 1 | 2 | 3 | 4 | 5 | 6 | 8 |
| | 1 | 0 | 0 | 0 | 0 | 0 | 1 |
| DILSW2 | 1 | 2 | 3 | 4 | 5 | 6 | 8 |
| | 1 | 0 | 0 | 0 | 1 | 1 | 1 |

4. Moving the game switches and controls will cause the "1's" to change to "0's" and vice versa. A "0" means that particular switch is "ON" or in the CLOSED condition and a "1" means that particular switch is "OFF" or in the OPEN condition. If you move a switch or control on the game and it has no effect on the above display, the switch/button is either not working, miswired, or disconnected. Check it out thoroughly.

5. By pressing the 1 and 2 PLAYER BUTTONS at the same time, the game will go to the cross hatch pattern display of the Self-Test mode. This may be used for alignments and checks of various types.

This pattern will remain sharp and clear for about 15 seconds and then it will change to a different rapidly changing one for about another 15 seconds as the game does a RAM check on itself.

If all the RAMs check good, the cross hatch pattern will return and appear to fade in and out for a short while as the game does a color check on itself before becoming sharp and clear again for another 15 seconds. This sequence continues to repeat itself until you decide to leave the Self-Test mode.

6. If a bad RAM chip is found by the game's internal check system during the Self-Test, the game indicates this to you by displaying any of the below coded on the monitor screen. The following table shows which code translates to which RAM chip locations on the Video P.C. Boards.

BAD RAM LOCATION INFORMATION

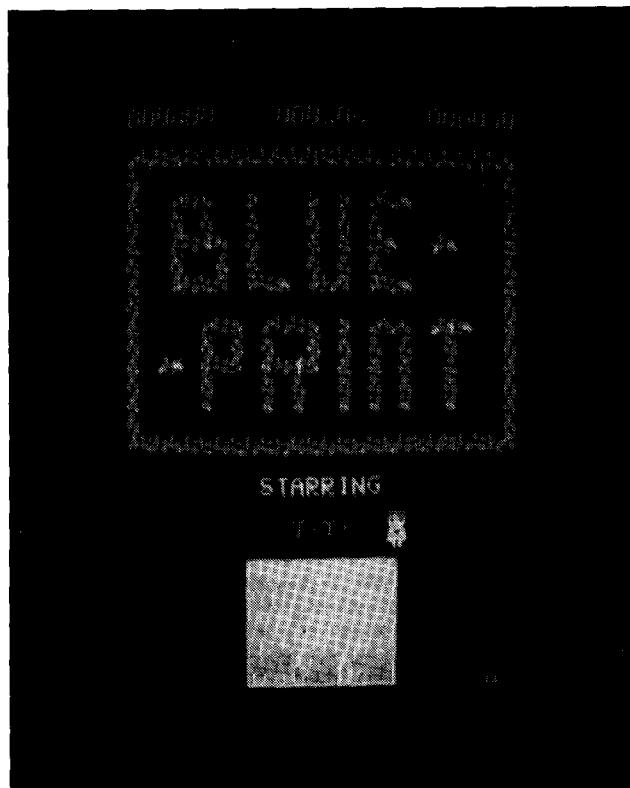

| SCREEN DISPLAY | ERROR DESCRIPTION | CHECK VIDEO P.C.B. CHIP LOCATIONS |
|----------------|-------------------------------|---|
| 0 DISPLAYED | SCRATCH PAD RAM ERROR | J1, K1, K2, J2, H2 |
| 1 DISPLAYED | BACKGROUND C H ERROR | B9, C7, C6, C9, C8, C10, F4, D6 |
| 2 DISPLAYED | BACKGROUND ROW POSITION ERROR | D8, D9, D10, D11, B10, D7, B9 |
| 3 DISPLAYED | FAST MOVING OBJECT RAM ERROR | D15, D16, D14, E16, E15, E17, C18, B13, B12, A13, A12, D2 |
| 7 DISPLAYED | BACKGROUND COLOR RAM ERROR | C11, C12, D12, D13, C9, C8, C10, F4, E14, B8 |

- When finished with the Self-Test mode, slide the Self-Test switch back to the "OFF" position, and turn the power to the game "OFF" and then back "ON" again.
- Normal game functions will now return to the monitor screen.

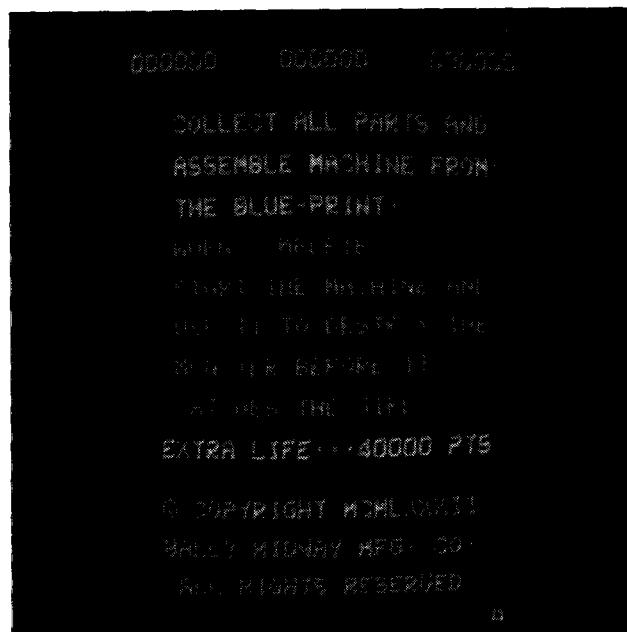

ATTRACT MODE

- The Attract mode starts:

- Just after power has been turned on to the game. (Self-Test switch is in the "OFF" position.)
- After a Self-Test has been completed. (Performing a Self-Test sets the credits in the game's memory to zero "0".)
- After a play has been finished, the score was not high enough to put the game into the High Score/Initial mode, and there are no more credits left in the game's memory.
- After the High Score/Initial mode when there are no more credits left in its memory.
- In the Attract mode, the game will give the following displays **centered** on the monitor screen:

Attract Mode Display 1

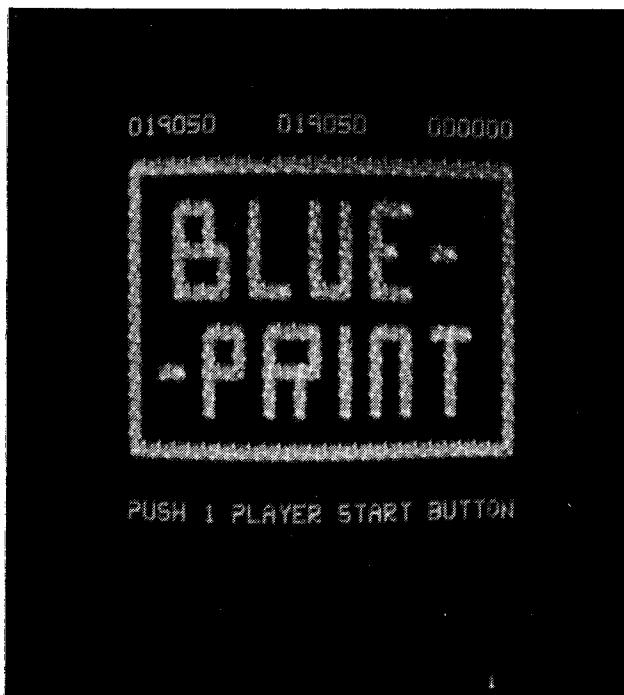

Attract Mode Display 2

THE THIRD DISPLAY IN THE ATTRACT MODE SEQUENCE SHOWS SIMULATED GAME PLAY

- The next display in the series lists the ten highest scoring individuals that have played the game to date.

| | RANK | 014050 | 014050 | 000000 |
|----|------|--------|--------|--------|
| 1 | RANK | 014050 | PTS | |
| 2 | | 000000 | PTS | |
| 3 | | 000000 | PTS | |
| 4 | | 000000 | PTS | |
| 5 | | 000000 | PTS | |
| 6 | | 000000 | PTS | |
| 7 | | 000000 | PTS | |
| 8 | | 000000 | PTS | |
| 9 | | 000000 | PTS | |
| 10 | | 000000 | PTS | |

- No matter where the game is in the Attract mode sequence, it will immediately go to the following display as soon as a game has been paid for. It will hold this display on the monitor screen until the "1 PLAYER" or the "2 PLAYER" start button is pushed.

Ready to Play Mode Display 1

READY-TO-PLAY MODE

1. The Ready-To-Play mode starts when enough coins have been accepted for a 1 or a 2 player game.
2. The Ready-To-Play mode ends when either the "1 PLAYER" or the "2 PLAYER" push button is pressed.
3. In the Ready-To-Play mode, the game will give the above display **centered** on the monitor screen.
4. If no START button is pressed, the game will hold the above display on the screen indefinitely.

PLAY MODE

The Play mode begins when either the "1 PLAYER" or the "2 PLAYER" start button is pressed. The "READY-TO-PLAY MODE" display changes color, maze appears, "1 UP" flashes, J.J. appears, and play begins.

The Play mode ends when all of your J.J.'s have had their hearts broken. When this happens, "GAME OVER" is written across the top center of the monitor screen.

In this game, the ogre is chasing J.J.'s girl friend across the top of the monitor screen. **And he's catching up to her!** The **ONLY** way J.J. can save her is to visit all the houses in the maze, collect all the parts needed, and construct the Ammo Machine shown in the BLUEPRINT at the bottom center of the monitor screen. An easy enough task you say — **WRONG!**

Unfortunately for J.J. he has a number of obstacles to overcome, not to mention a time limit, before he will

Ready to Play Mode Display 2

be able to get the Ammo Machine completely built. Among these obstacles is the fact that two of the houses in the maze contain bombs instead of parts of the Ammo Machine. If he gets one of these, he must make his way to the bomb disposal pit at the lower right hand corner of the monitor screen **BEFORE** it explodes and throw it in. Also, if he enters any house that previously held a part for the Ammo Machine, he will come out with a bomb. This bomb must be thrown into the bomb disposal pit too. If any of the bombs explode **BEFORE** J.J. can throw them into the pit, you will lose one man. And if this is not enough, J.J. must accomplish all of the above while keeping an eye out for the KILLER FLOWER POTS. If he is so much as even slightly touched by one of these little devils, you will lose one man.

And then there's Weird Willie. He's a sort of cute little guy but he's got a screw loose somewhere. I mean, what other reason could you think of for anyone setting up housekeeping in a bomb disposal pit???

At any rate, J.J.'s got to keep an eye out for him. (Now you must understand that Weird Willie doesn't dislike J.J. It's just that he has this odd sense of humor.) If he gets out and J.J. allows him to run around the bottom of the screen, Weird Willie will eventually work his way over to the START BUTTON for the Ammo Machine and press it **BEFORE** it is complete. This will cause the unfinished Ammo Machine to fall apart. J.J. must grab Weird Willie and toss him back in his pit at the lower right hand corner of the screen. But Weird Willie is very persistent and will try it again sooner or later.

J.J. also has to remember not to touch that same START BUTTON before he completes construction

of his Ammo Machine. It will fall apart just as fast and as surely if he touches it as it does when Weird Willie touches it.

Once the Ammo Machine is built, J.J. must push the START BUTTON for it (located at the lower left hand corner of the screen). Once this is done, the Ammo Machine will start firing at the ogre chasing J.J.'s girl friend across the top of the screen. You can move the Ammo Machine back and forth across the bottom of the screen at this time by moving the control stick left or right. It does not move up and down on the screen.

As your skill level increases and you get into the higher racks, the ogre runs faster, the bomb fuses are shorter, a maze monster will appear which can cause you to lose one man if you touch him (in which rack he appears is switch selectable), and you will lose first the far left exit from the maze and then the far right exit from the maze leaving only the center exit from the maze for all future racks. In general, each maze will be harder to complete than the one before.

A bonus man is awarded to you as you reach or pass a certain preselected point value (switch selectable).

WAYS IN WHICH YOU CAN LOSE A MAN (J.J.):

1. J.J. doesn't make it to the bomb disposal pit with a bomb, it goes off before he gets there. J.J., complete with halo, ascends to heaven. Assuming you have at least one J.J. in reserve, nothing happens to the parts of the Ammo Machine that you've already assembled on the BLUEPRINT.
2. The ogre catches J.J.'s girl friend. J.J.'s heart breaks and complete with halo, he ascends to heaven. Assuming you have at least one J.J. in reserve, nothing happens to the parts of the Ammo Machine that you've already assembled on the BLUEPRINT.
3. In the later racks, if J.J. should touch the maze monster. Then, complete with halo, J.J. ascends to heaven. Assuming you have at least one J.J. in reserve, nothing happens to the parts of the Ammo Machine that you've already assembled on the BLUEPRINT.
4. Any time J.J. is touched by a Killer Flower Pot. Then, complete with halo, J.J. ascends to heaven. Assuming you have at least one J.J. in reserve, nothing happens to the parts of the Ammo Machine that you've already assembled on the BLUEPRINT.

WHEN YOU LOSE YOUR LAST MAN (J.J.):

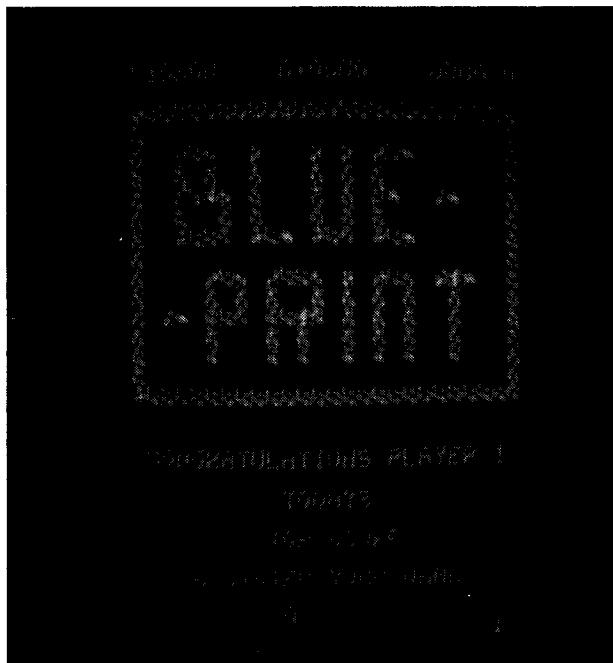

When you loose your last J.J. **GAME OVER PLAYER 1**" is written across the top center of the monitor screen. At this point several different things can happen depending on whether or not your score was high enough to cause the game to go into the High Score/Initial mode.

If your score was one of the ten highest of the day, the game will go into the High Score/Initial mode imme-

dately. If your score is not high enough to cause the game to go into the High Score/Initial mode, it will either go to the Attract mode (if there are no more credits left in its memory) or into the Ready-To-Play mode (if there are still credits left in its memory).

HIGH SCORE/INITIAL MODE

In the High Score/Initial mode the game gives a display which looks like the following:

High Score/Initial Mode Display

When in the High Score/Initial mode, there is an "A" and two blank spaces displayed at the bottom center of the screen. By moving the controller stick to the right, the letter can be made to sequence forward through the alphabet: "A", "B", "C", "D", etc. By moving the controller stick to the left, the letter can be made to sequence backward through the alphabet: "Z", "Y", "X", "W", etc.

When you reach your initial, release the controller and push the FAST button. Your initial is frozen in place and an "A" appears in the blank space next to your first initial at the same time. Select this and your last initial in the same manner as you did your first initial. If you do not wish to put your initials opposite your score, just press the FAST button three times. Three "A"s will appear in the spaces at the bottom of the monitor screen where your initials would have gone.

After the High Score/Initial mode, the game will either go to the Attract mode (if there are no more credits left in its memory) or into the Ready-To-Play mode (if there are still credits left in its memory).

Most of the above holds true in the "2 PLAYER" mode also. But there are a few minor differences.

TWO PLAYER OPERATION

The Upright, Mini, and Cocktail Table models all have two player operation.

In the two player mode, the rules of play are the same as in the single player mode. There are some additional rules, however.

1. In the Upright and Mini models, the players must take turns at the controls.
2. In the Cocktail Table model, each player has his own set of individual controls. The picture will flip to face you when it is your turn. (When it is not your turn, your set of controls will have **NO** effect on the game.)
3. Your turn lasts until you lose one J.J. At this point, the game will do one of several things depending on whether or not the lost J.J. was your last or if you still have others remaining in reserve.

J.J. LOST — OTHERS STILL REMAINING IN RESERVE

- J.J., complete with halo, ascends to heaven.
- Next, the "RACK" changes to the "RACK" the other player is in, the "____ UP" flashes while what's left of the other player's Ammo Machine, his maze, and his J.J. appear on the monitor screen.
- Play begins for the other player.

J.J. LOST — NO OTHERS REMAINING IN RESERVE

- Game displays "GAME OVER PLAYER ____".
- J.J., complete with halo, ascends to heaven.
- Next, the "RACK" changes to the "RACK" the other player is in, the "____ UP" flashes while what's left of the other player's Ammo Machine, his maze, and his J.J. appear on the monitor screen.
- Play begins for the other player.
- After the last player's last J.J. is lost, the game displays "GAME OVER PLAYER ____" for him too.
- If neither of your scores is high enough to cause the game to go into the High Score/Initial mode, the game will then either go to the Attract mode (if there are no more credits left in its memory) or into the Ready-To-Play mode (if there are still credits left in its memory).
- On the other hand, if one or both of your scores was high enough to cause the game to go into the High Score/Initial mode, the game will tell you this by giving a display like that shown previously. The number "1" or "2" is displayed where the blank space is to indicate which player should enter his initials at this time.
- After you've entered your initials opposite your score(s), the game will then go to the list of high scorers after which it will either go to the Attract mode (if there are no more credits left in its memory) or into the Ready-To-Play mode (if there are still credits left in its memory).

IV. Maintenance and Repair

Your **NEW** game needs certain types of maintenance to keep it in good working order. **CLEAN**, well **MAINTAINED** games **attract players** and **EARN MORE PROFITS**.

The most important thing for you to remember is to play your game thoroughly **EVERY TIME** you collect money from the coin box. **JUST LOOKING** at your game **WILL NOT** tell you if all its controls and inside parts are working correctly. **ONLY** being familiar with and playing your game will inform you whether or not it is working the way it should.

The second most important thing you should remember is to clean the outside of the game and coin acceptor mechanisms on a regular basis.

CLEANING

The outside of the game cabinet plus the metal can be cleaned with any non-abrasive household cleaner. However, the front of the T.V. monitor tube and **both sides** of all other glass and plastic on or in the game **MUST** be cleaned with anti-static cleaner **ONLY**. For cleaning the coin acceptors: hot soapy water may be used on the plastic ones and any household cleanser may be used on the metal ones. If you wish, special coin machine cleaners that leave no residue may be purchased from your distributor.

DO NOT dry-wipe any of the plastic panels. This is because any dust that was on them can scratch their surfaces. If this has happened, anyone looking through this type of damaged plastic would feel he was looking at the game through a fog. This fogging

damage **CANNOT** be repaired or reversed. The **ONLY** solution is to **replace** the damaged piece of plastic.

FUSE REPLACEMENT

This game contains several fuses located as shown in Figure 4-1.

1. UPRIGHT MODEL:

As viewed from the back, facing the cabinet, with the rear access door removed; the fuses are located on the Transformer and Power Supply Board Assemblies.

2. MINI MODEL:

As viewed from the back, facing the cabinet, with the rear access door removed; the fuses are located on the Transformer and Power Supply Board Assemblies.

3. COCKTAIL TABLE MODEL:

As viewed from the coin door side of the cabinet, with the monitor tilted open to one side; the fuses are located on the Transformer and Power Supply Board Assemblies.

Replace fuses **ONLY** with the type and size listed in the Illustrated Parts Breakdown Section of this manual.

See the T.V. Monitor Manual (available on request from your distributor or the monitor manufacturer) and/or the T.V. Troubleshooting Section of this manual for information on these fuses.

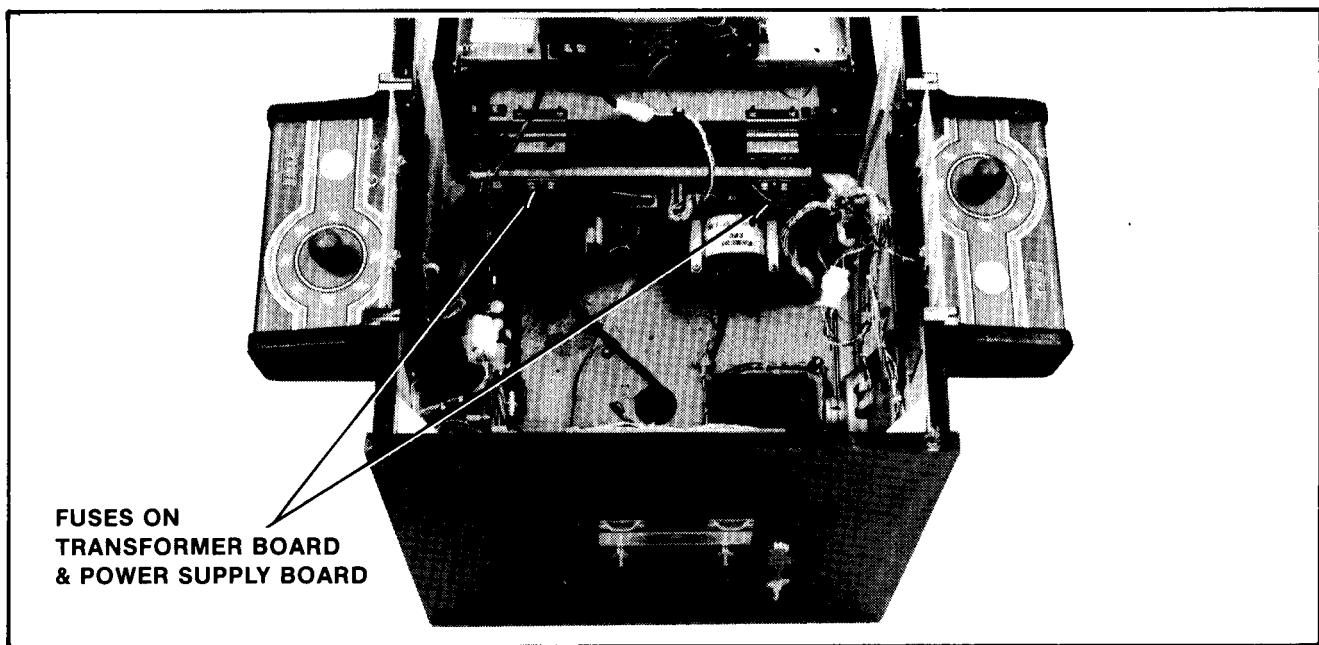

Figure 4-1 Location of Fuses

OPENING THE CONTROL PANEL

1. UPRIGHT MODEL: See Figure 4-2.

- The control panel is held in place by three latches, one on the left side, one on the right side, and one on the front center.

They are spring loaded to provide constant positive pressure on their latch plates.

They can be reached through the coin door **AFTER turning power to the game off.**

To release the latches, lift up and toward the center of the control panel.

Once they are released, unhook them from their latch plates.

- To remove the control panel:

Raise it up and tilt it toward you until you can see the cable behind it.

Cradling the control panel between yourself and the cabinet, disconnect it from its cabling.

The control panel is now free and can be removed.

- To reinstall the control panel, reverse this procedure.

2. MINI MODEL: See Figure 4-2.

- The control panel is held in place by two latches, one on the right side, and one on the left side of the cabinet.

They are spring loaded to provide constant positive pressure on their latch plates.

They can be reached through the coin door **AFTER turning power to the game off.**

To release the latches, lift up and toward the center of the control panel.

Once they are released, unhook them from their latch plates.

- To remove the control panel:

Raise it up and tilt it toward you until you can see the cable behind it.

Cradling the control panel between yourself and the cabinet, disconnect it from its cabling.

The control panel is now free and can be removed.

- To reinstall the control panel, reverse this procedure.

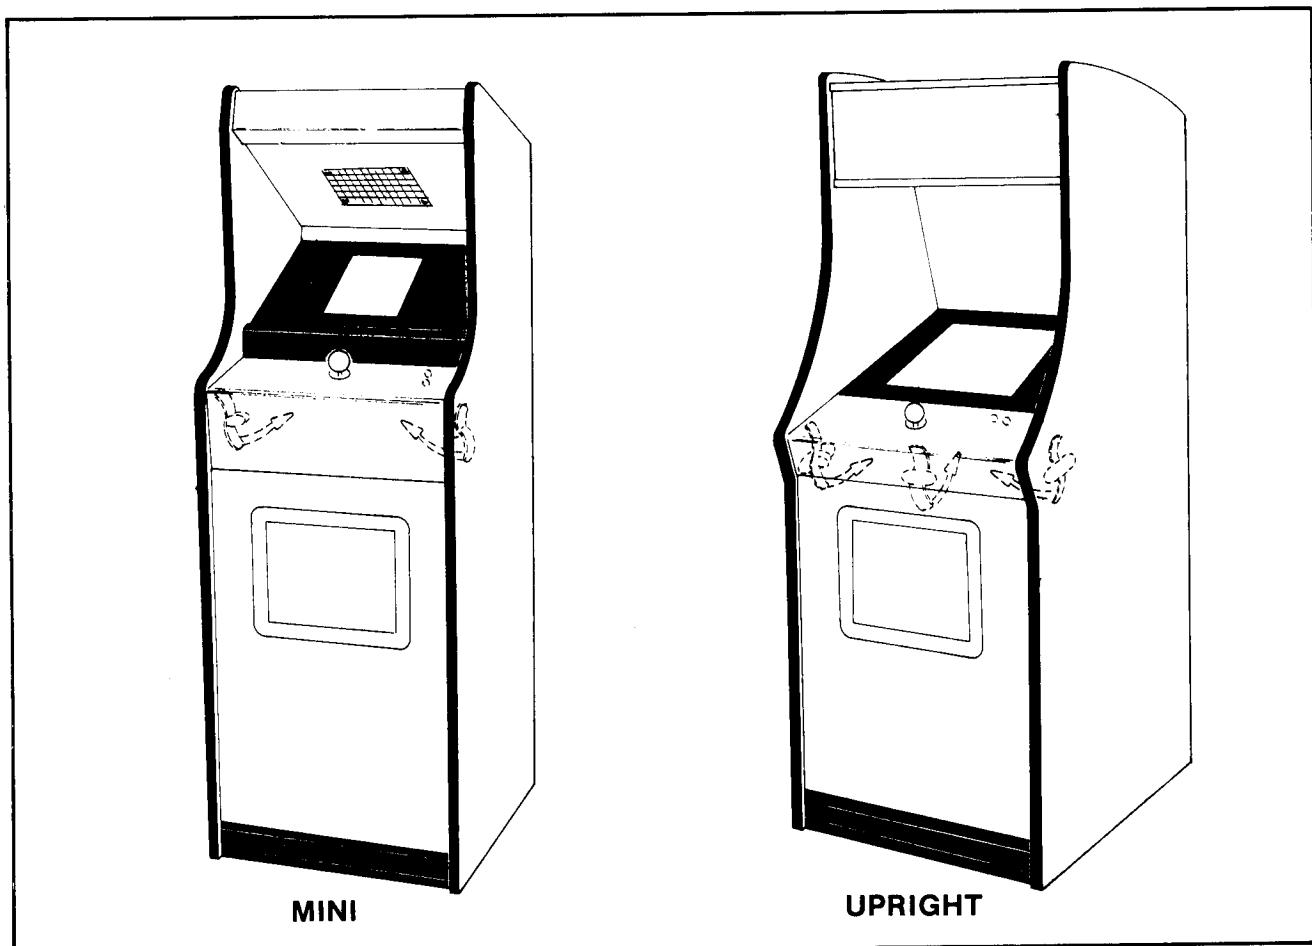

Figure 4-2 Opening the Control Panel — Upright & Mini

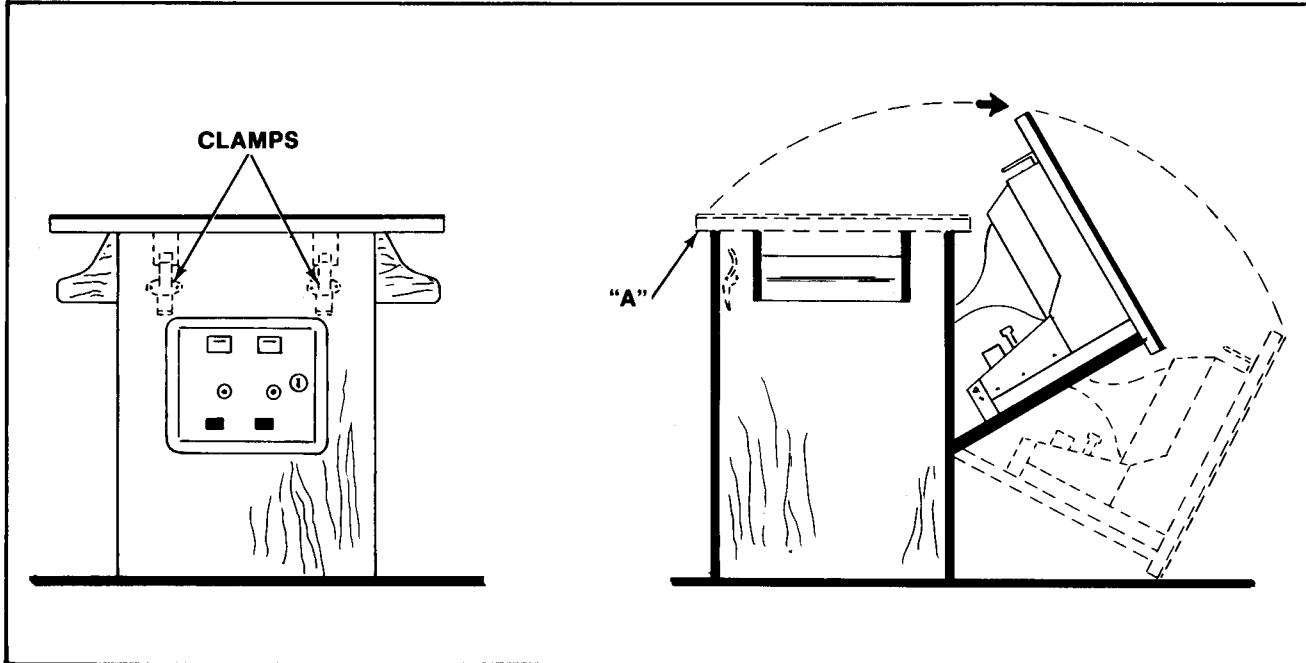

Figure 4-3 Opening the Cocktail Game

3. COCKTAIL TABLE MODEL: See Figure 4-4.

- Each control panel is held in place by several screws, two on the inside of the cabinet and three along the outside bottom edge of the control panel.

Turn power to the game off.

Open the coin box door and release the two latches indicated in Figure 4-3.

CAUTION: The right hand latch is very close to the HIGH VOLTAGE on the monitor.

Once they're released, unhook them from their latch plates.

Grasp the table top at "A" and open it as indicated in Figure 4-3.

CAUTION: Due to the weight of the monitor, EXTREME CARE MUST be taken when opening the cabinet.

Remove the screws which secure the control panel in place. See Figure 4-4.

- To remove the control panel(s):
Disconnect it from its cabling.
The control panel is now free and can be removed.
- To reinstall the control panel, reverse this procedure.

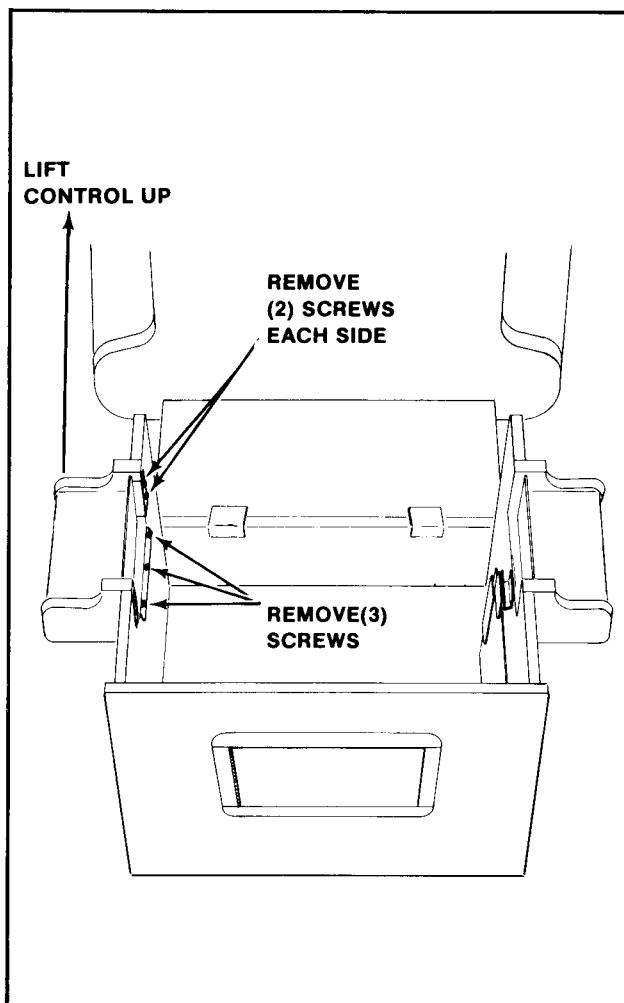

Figure 4-4 Removing the Control Panel — Cocktail

REMOVAL OF THE MAIN-DISPLAY-GLASS AND/OR THE T.V. BEZEL ASSEMBLY

1. UPRIGHT MODEL: See Figure 4-5.

NOTE: In order to do this, the control panel **MUST** be removed first. See the "UPRIGHT MODEL" procedure.

- Turn the power to the game off and remove the control panel. This frees the main-display-glass so it can be lifted off.
- By putting your finger in the hole in the middle of the main-display-glass support, you can lift it up and out.
- Loosen the screws which secure the T.V. bezel-glass-clamps in place.
Move the clamps to the side and the bezel glass may be removed.
Remove the above mentioned screws and the bezel with four bezel-glass-clamps may be removed.
- To reinstall the T.V. bezel assembly and the main-display-glass, reverse this procedure.

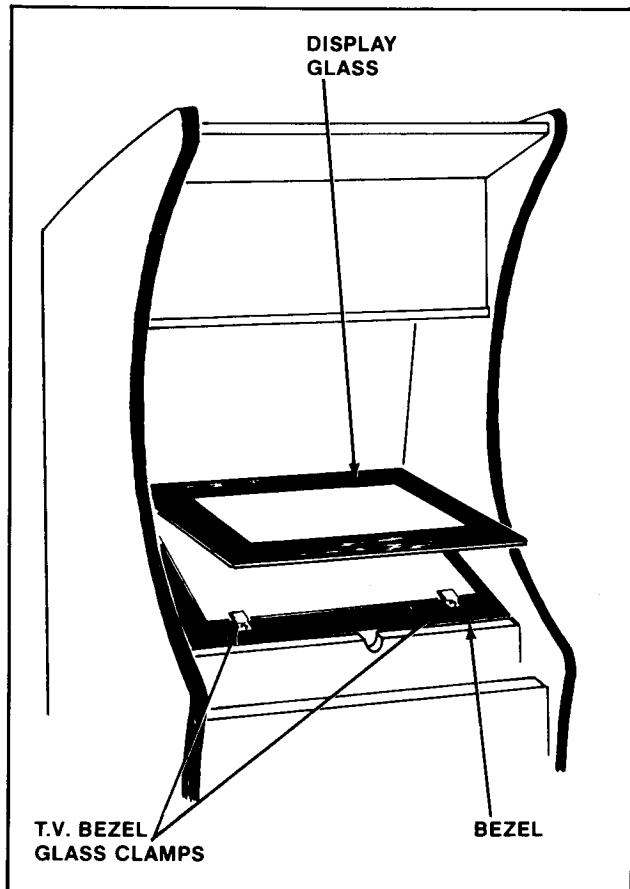

Figure 4-5 Removal of Main Display Glass & T.V.
Bezel — Upright

2. MINI MODEL: See Figure 4-6.

NOTE: In order to do this, the control panel **MUST** be removed first. See the "MINI MODEL" procedure.

- Turn the power off to the game and remove the control panel.
- Remove the screws which secure the glass clamping plate.
- Lift out the glass clamping plate. This frees the main-display-glass so it can be lifted up.
- By putting your finger in the hole in the middle of the main-display-glass support, you can lift it up and out.
- Remove the screws which secure the T.V. bezel assembly and lift it out.

NOTE: Use the hole in the center of the main-display-glass support to grasp it.

- Reverse this procedure to reinstall the T.V. bezel assembly and the main-display-glass.

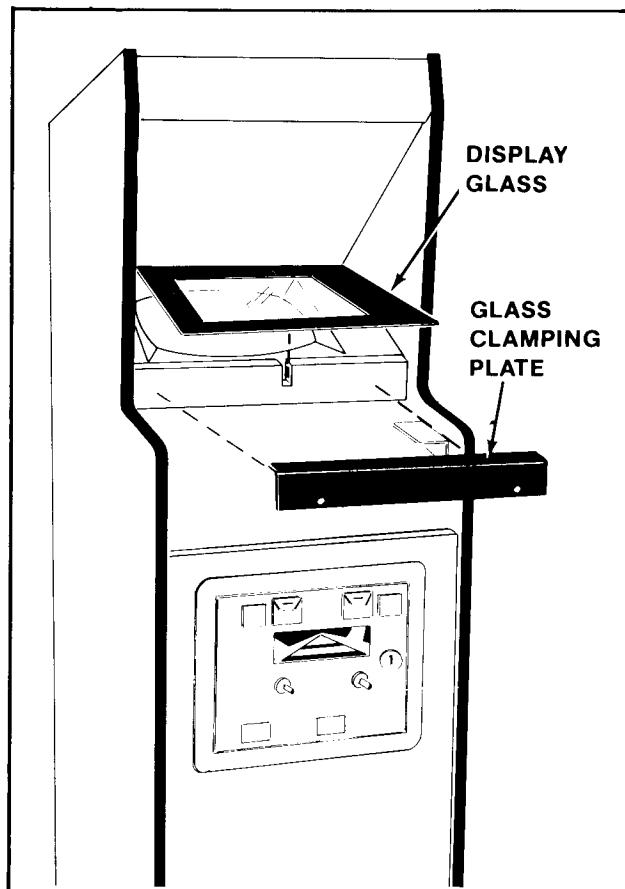

Figure 4-6 Removal of Main Display Glass & T.V.
Bezel — Mini

3. COCKTAIL TABLE MODEL: See Figure 4-7.

NOTE: This may be done with the table top in the open or the closed position. If you decide to open the table top, **TURN THE POWER TO THE GAME OFF FIRST.**

- Remove the screws which secure the table top glass clamps in place.
- Remove the table top glass.
- Loosen the screws which secure the T.V. bezel-glass-clamps in place.
Move the clamps to the side and the bezel glass may be removed.
Remove the screws which secure the bezel assembly to the table top and the bezel with four bezel-glass-clamps may be removed.
- To reinstall the T.V. bezel assembly and the table top glass, reverse this procedure.

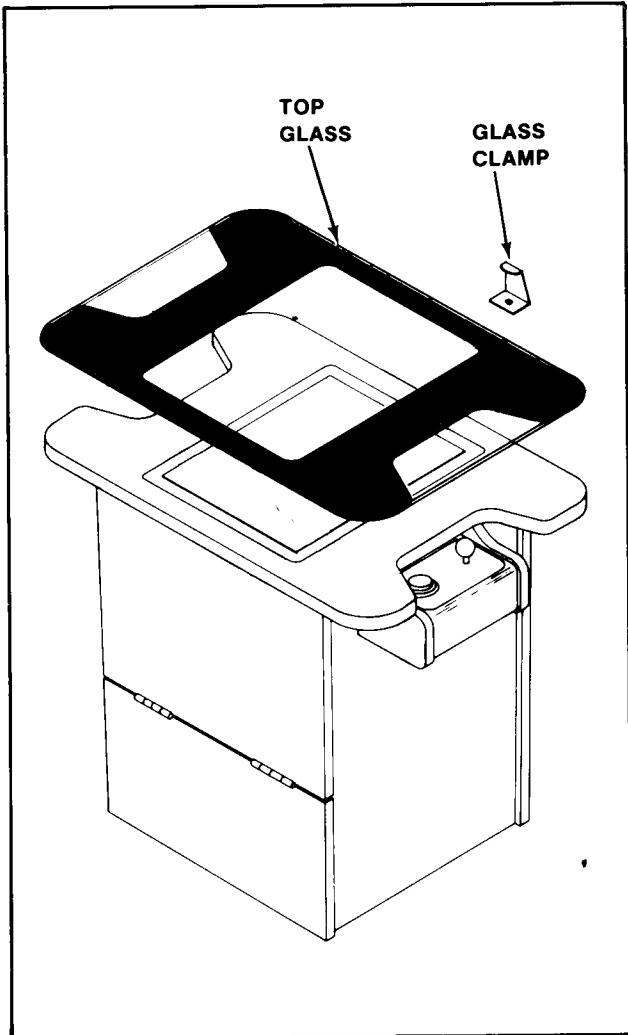

Figure 4-7 Removing Top Glass — Cocktail

T.V. MONITOR REPLACEMENT

CAUTION: High voltages may exist in any television unit, even with the power disconnected. Use **EXTREME CAUTION** and do not touch electrical parts or the T.V. yoke area with your hands or with metal objects held in your hands!

In addition, **BE SURE TO USE HEAVY GLOVES** when handling the monitor. You could cut your hands on the metal T.V. chassis without such protection.

DANGER: The T.V. monitor **DOES NOT** contain an isolation transformer on its chassis (it is mounted instead on the floor of the cabinet). When servicing the monitor on a test bench, **YOU MUST ISOLATE THE MONITOR FROM AC VOLTAGE WITH AN ISOLATION TRANSFORMER.**

1. UPRIGHT MODEL: See Figure 4-8.

- Turn power off to the game.
- Open the rear access door.
- Completely disconnect the T.V. monitor from all its cabling. **DON'T FORGET THE CHASSIS GROUND WIRE.**

Before removing the T.V. monitor, the main-display-glass **MUST** be removed. See above "Upright Model" procedure.

With the removal of only four bolts, the T.V. monitor and its mounting channels will be loose.

The monitor mounting channels slide on top of and against two metal guides mounted to the cabinet's right and left sides. The monitor is removed by sliding it out the back of the cabinet.

To reinstall the T.V. monitor, reverse this procedure.

After replacing the T.V. monitor, be sure to run the game Self-Test.

2. MINI MODEL: See Figure 4-9.

- Turn the power off to the game.
- Open the rear access door.
- Completely disconnect the T.V. monitor from all its cabling. **DON'T FORGET THE CHASSIS GROUND WIRE.**

Before removing the T.V. monitor, the main-display-glass and bezel **MUST** be removed. See above "Mini Model" procedure.

With the removal of only four nuts, the T.V. monitor will be loose.

CAUTION: BE SURE to support the T.V. monitor from the rear while removing the four bolts so it will not fall out of the cabinet.

The monitor is removed by supporting it and pulling straight back.

- To reinstall the T.V. monitor, reverse this procedure.

After replacing the T.V. monitor, be sure to run the game Self-Test.

3. COCKTAIL TABLE MODEL: See Figure 4-11.

- Turn the power off to the game.

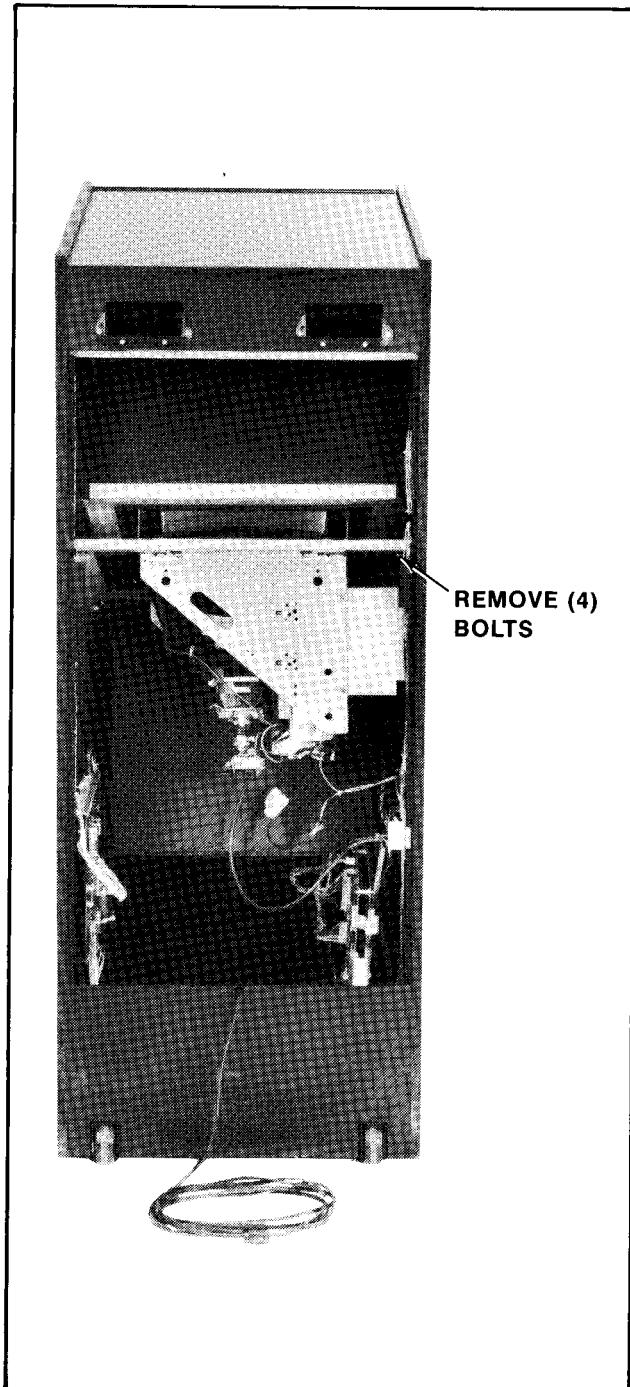

Figure 4-8 Removing Monitor — Upright

Open the coin box door and release the two latches indicated in Figure 4-10.

CAUTION: The right hand latch is very close to the HIGH VOLTAGE on the monitor.

- Once the latches are released, unhook them from their latch plates.

- Grasp the table top at "A" and open it as indicated in Figure 4-10.

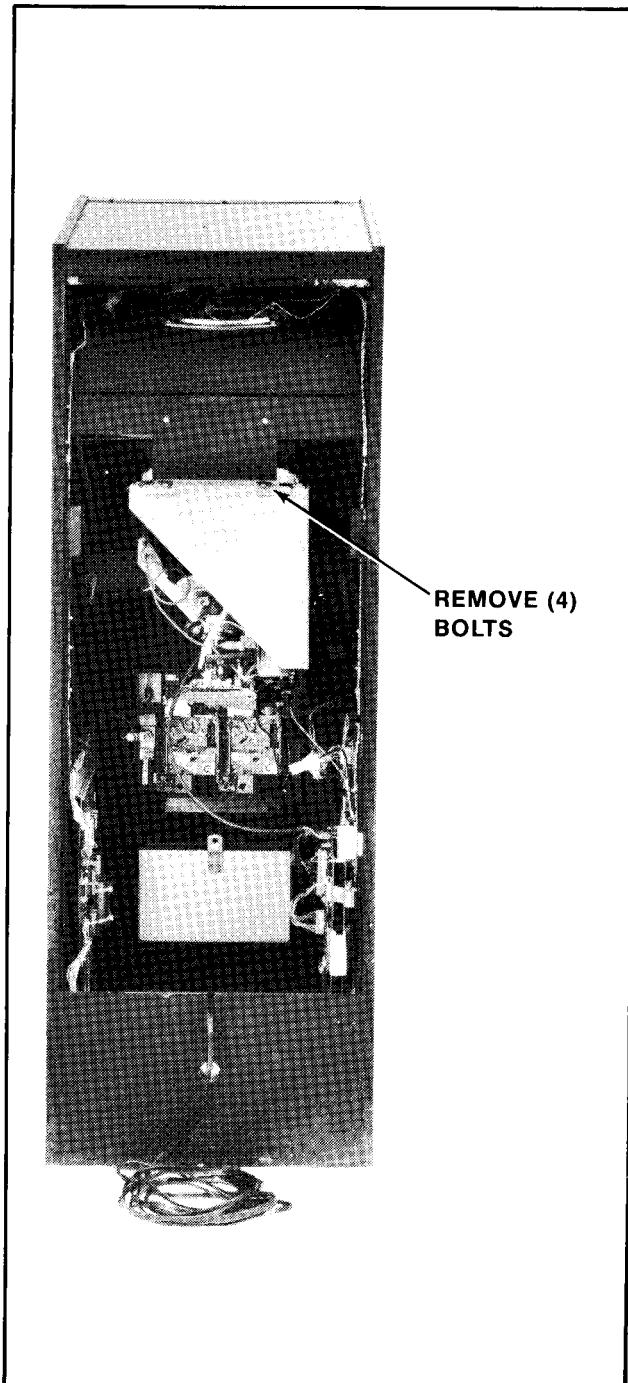

Figure 4-9 Removing Monitor — Mini

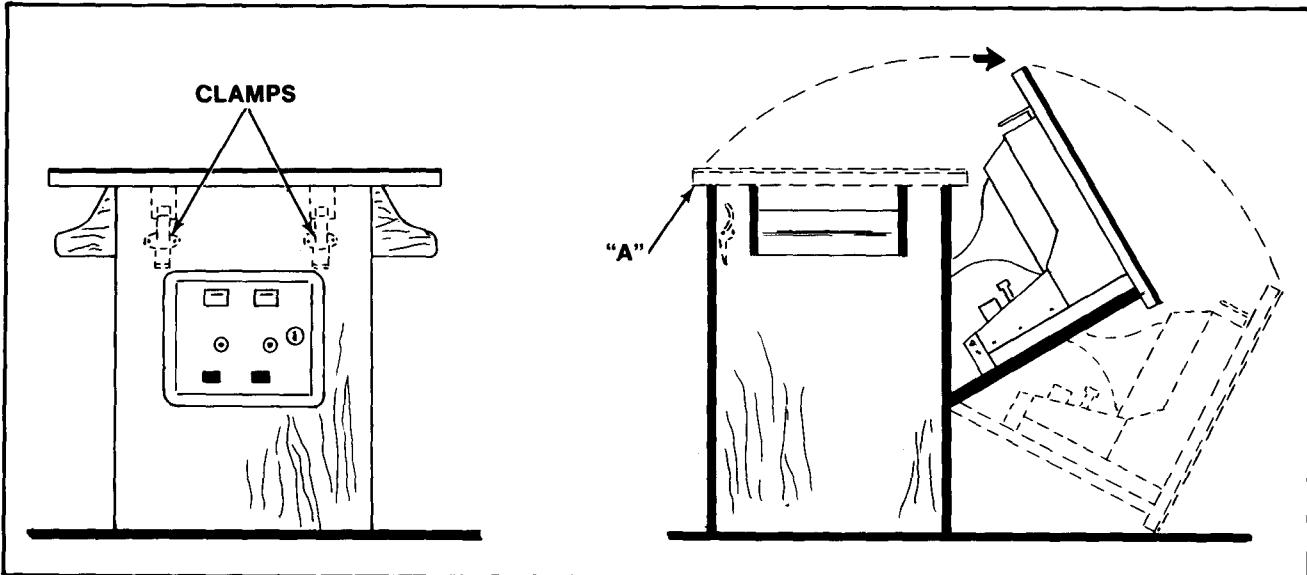

Figure 4-10 Opening the Cocktail Game

CAUTION: Due to the weight of the monitor, EXTREME CARE MUST be taken when opening the cabinet.

- Remove the screws which hold the table top glass clamps in place.
- Remove the table top glass.
- Lift out the T.V. bezel assembly.
- Completely disconnect the T.V. monitor from all its cabling. **DON'T FORGET THE CHASSIS GROUND WIRE.**
- Remove the screws holding the T.V. monitor chassis to the "L" brackets by the door hinge(s). See Figure 4-11.
- Close the Cocktail Table and re-latch it.
- Remove the screws which secure the T.V. monitor mounting brackets to the edges of the slot cut in the table top. See Figure 4-11.
- Pry up the end of each monitor mounting bracket with a screwdriver or similar tool until you can grasp them both.
- Lift the T.V. monitor straight up and out of the table top being VERY CAREFUL not to bump the neck of the picture tube.
- To reinstall the T.V. monitor assembly, reverse this procedure.
- Be sure to check the clearance of the "L" brackets BEFORE setting the monitor into the table top.
- After replacing the T.V. monitor, be sure to run the game Self-Test.

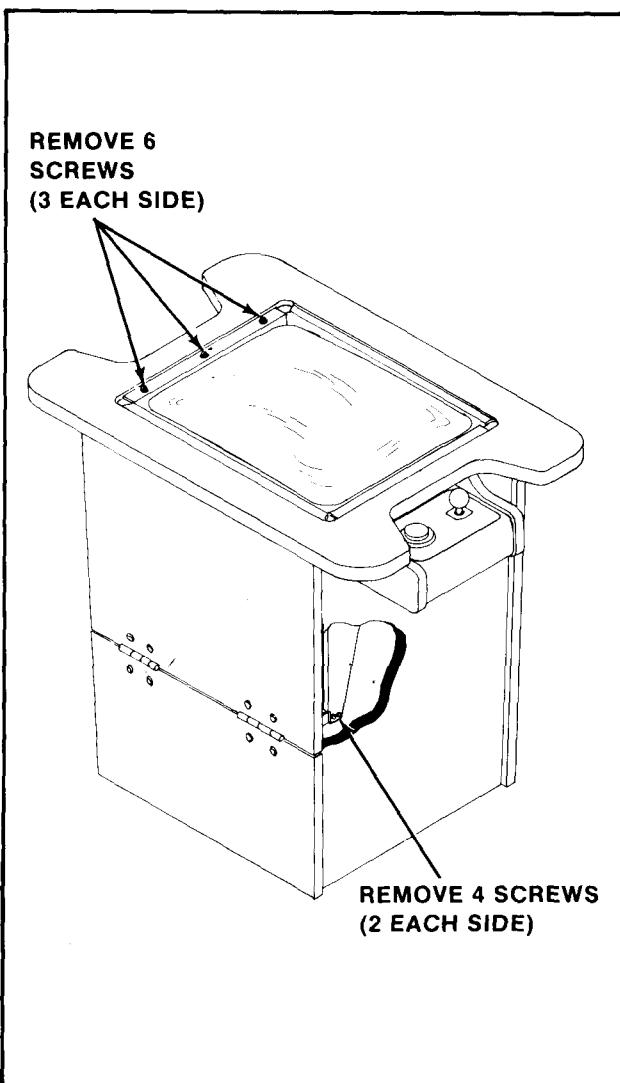

Figure 4-11 Removing Monitor — Cocktail

PRINTED CIRCUIT BOARD (P.C.B.) REPLACEMENT

1. UPRIGHT MODEL: See Figure 4-12.

- Turn the power to the game off.
- Unlock and open the rear access door (game board) and the coin door (sound board).
- Disconnect the game board from all its cabling.
- Disconnect the sound board from all its cabling.
- Remove the indicated P.C.B. supports and lift the above P.C.B.'s out the cabinet.
- Disconnect the power supply board from all its cabling, remove the P.C.B. supports indicated in Figure 4-12, and slide it out the back of the cabinet.
- To reinstall the above P.C.B.'s, reverse this procedure.

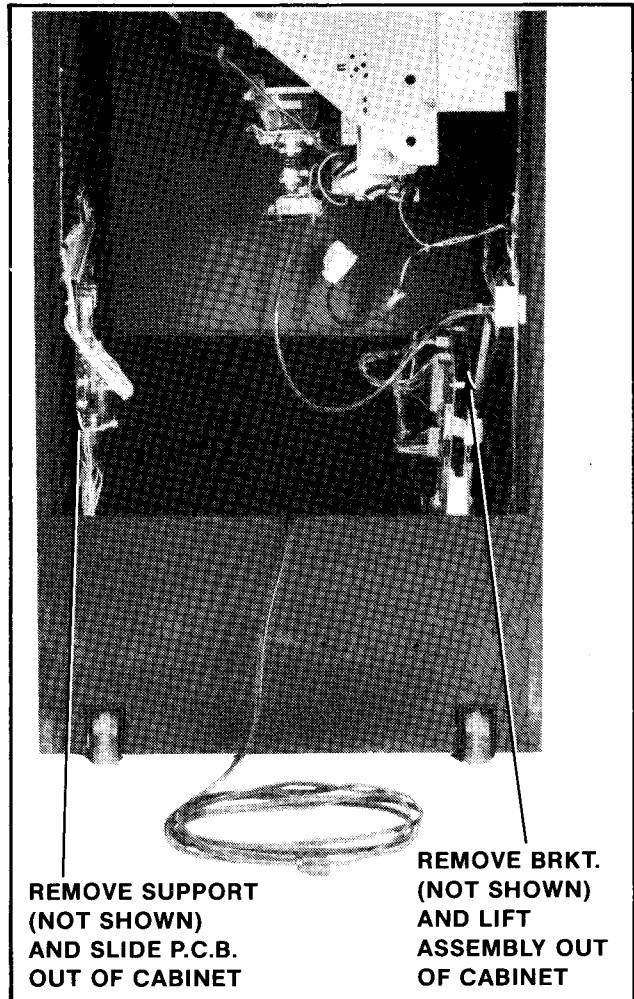

Figure 4-12 Replacing P.C.B.s — Upright

NOTE: P.C.B.'s are all keyed and will ONLY fit into their connectors one way without forcing them. The plugs on the cable harness which connect it to the P.C.B.'s are also keyed and will ONLY go onto their connectors one way without forcing them.

2. MINI MODEL: See Figure 4-13.

- Turn the power off to the game.
- Unlock and open the rear access door.
- Disconnect the game board from all its cabling.
- Disconnect the sound board from all its cabling.
- Remove the indicated P.C.B. supports and lift the above P.C.B.'s out of the cabinet.
- Disconnect the power supply board from all its cabling, remove the P.C.B. supports indicated in Figure 4-13, and slide it out the back of the cabinet.
- To reinstall the above P.C.B.'s, reverse this procedure.

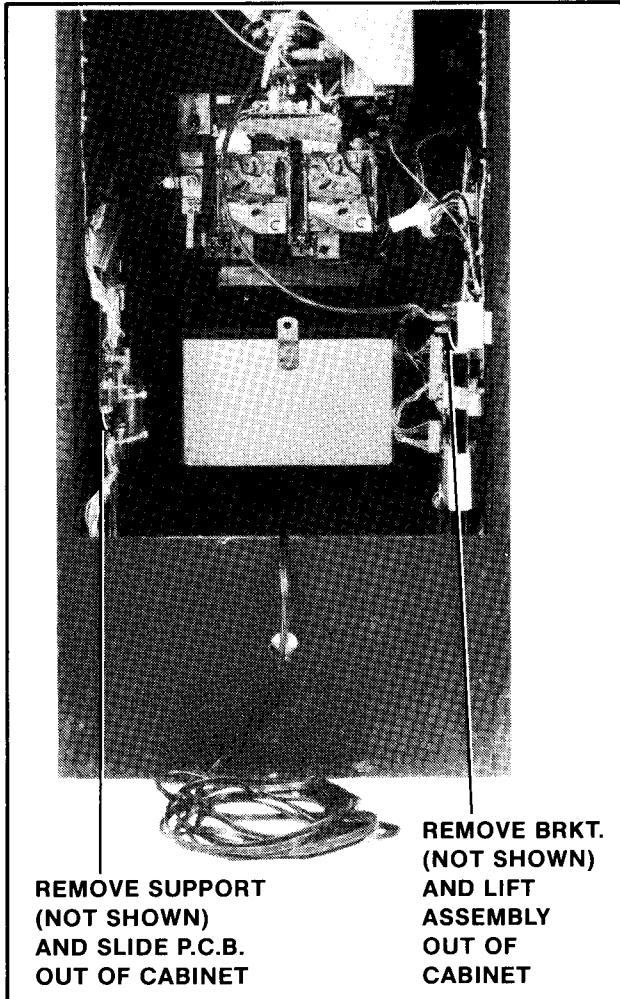

Figure 4-13 Replacing P.C.B.s — Mini

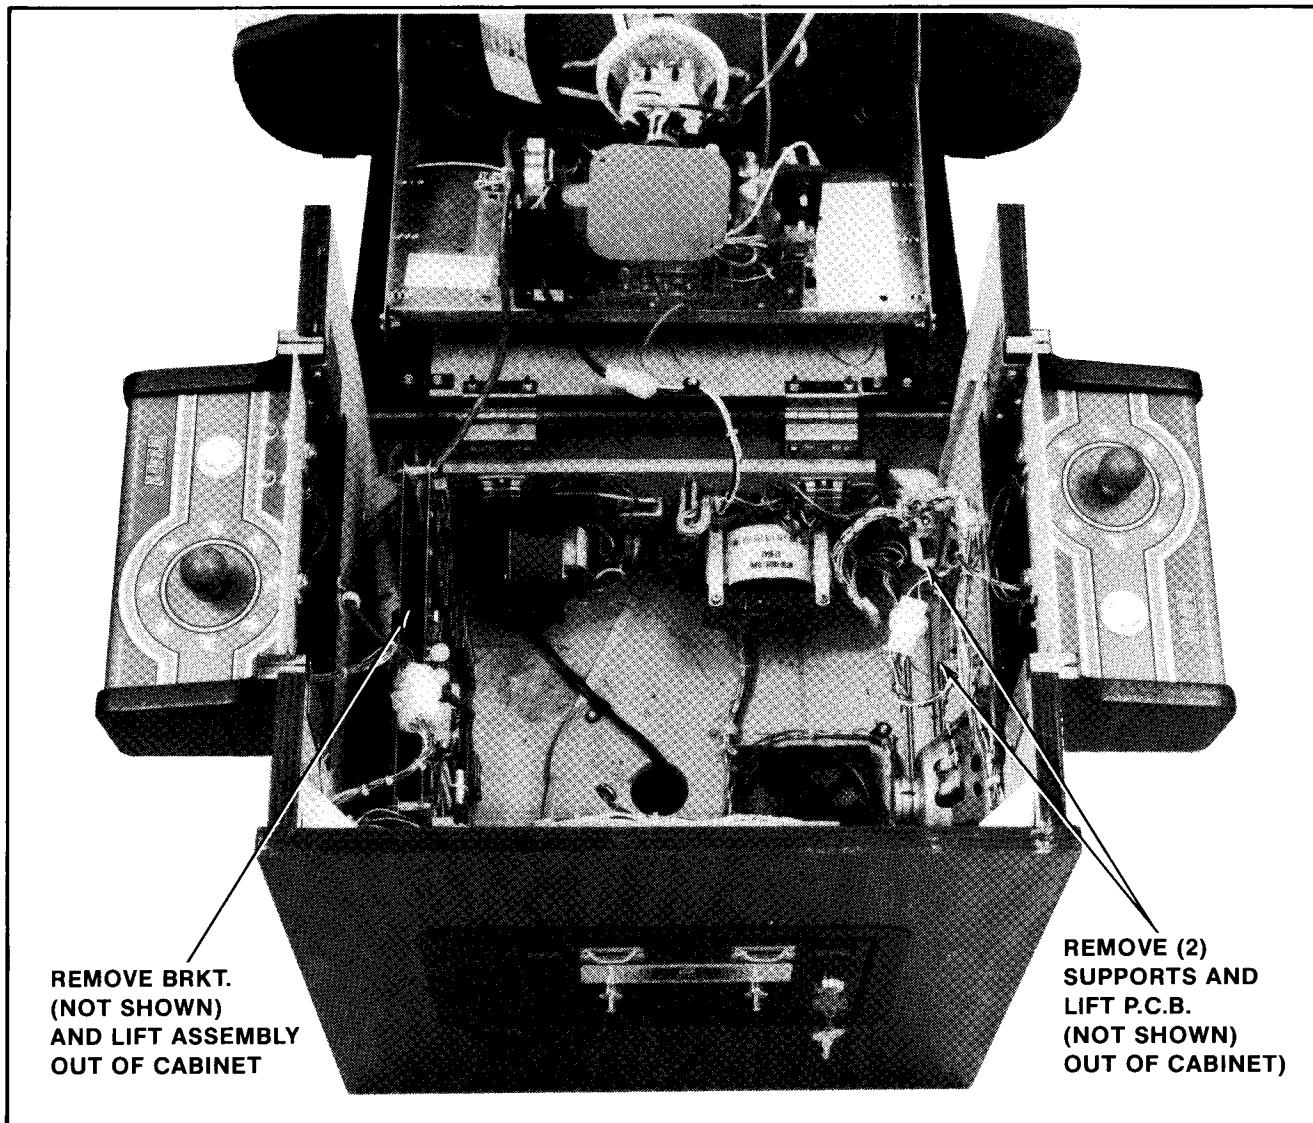

Figure 4-14 Replacing P.C.B.s — Cocktail

3. COCKTAIL TABLE MODEL: See Figure 4-14.

- Turn the power off to the game.
- Open the cabinet:
Open the coin box door and release the two latches indicated in Figure 4-10.

CAUTION: The right hand latch is very close to the HIGH VOLTAGE on the monitor.

Once they're released, unhook them from their latch plates.

- Grasp the table top at "A" and open it as indicated in Figure 4-10.

CAUTION: Due to the weight of the monitor, EXTREME CARE MUST be taken when opening the cabinet.

- To remove the power supply board. See Figure 4-14.
Disconnect it from all its cabling.
Remove the two smallest P.C.B. supports.
Once these are removed, the power supply can be lifted out the top of the cabinet.
To reinstall the power supply board, reverse this procedure.
- To remove the game and sound boards. See Figure 4-14.
Disconnect the game board from all its cabling.
Disconnect the sound board from all its cabling.
- Remove the indicated P.C.B. supports and lift the above P.C.B.'s out of the cabinet.
To reinstall the game and sound boards, reverse this procedure.

OPENING THE ATTRACTION PANEL

1. UPRIGHT MODEL: See Figure 4-15.

- Turn the power to the game off.
- Opening the attraction panel:
 - Remove the screws which secure the top bracket in place. (They are on its top side.)
 - Remove the top bracket and slide up the attraction panel. This exposes the attraction panel fluorescent light tube and its mounting bracket assembly.
 - To reinstall the attraction panel, reverse this procedure.
- The fluorescent light tube may be replaced at this time. BE CAREFUL NOT TO DROP IT.

WARNING: If you drop a fluorescent tube and it breaks, IT WILL IMPLODE! Shattered glass can fly six (6) feet or more from the implosion. Use care when replacing any fluorescent tube.

- Replacing the fluorescent tube starter. See Figure 4-16.
Be sure the power to the game has been turned off.

Grasp the starter (it is on the back of the mounting bracket), give it a quarter turn, and remove it from its socket.

To replace the fluorescent light tube starter, reverse this procedure.

- Replacement of the fluorescent tube mounting bracket assembly.

Be sure the power is off to the game.

Disconnect it from its power cable.

Remove the screws which secure it and gently slide it out of the front of the cabinet, being careful not to catch its power cable on anything.

To reinstall the fluorescent tube mounting bracket assembly, reverse this procedure.

- Replacing the speaker.

Be sure the power is off to the game.

Remove the attraction panel and disconnect the speaker from its cabling.

Remove the nuts and bolts which secure the speaker and speaker grill in place and set them and the speaker grill aside.

Once the bolts which secure the speaker in place are removed, the speaker may be removed through the opening where the attraction panel was.

Reverse this procedure to reinstall the speaker.

Figure 4-15 Opening the Attraction Panel — Upright

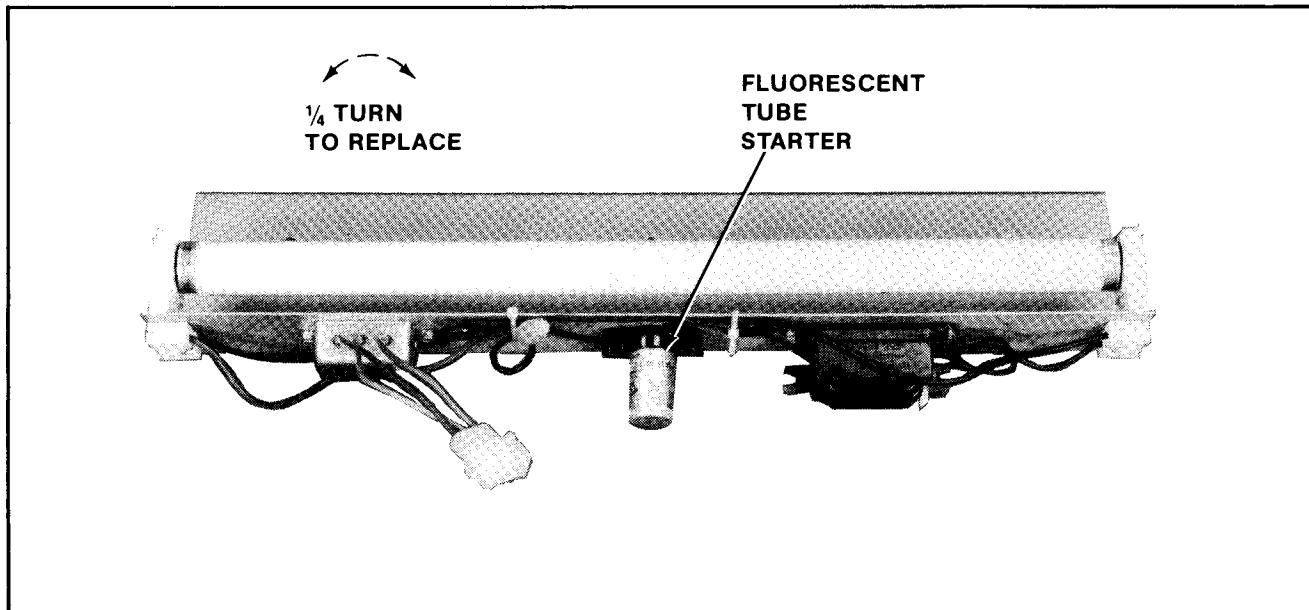

Figure 4-16 Replacing Fluorescent Tube Starter — Upright

2. MINI MODEL. See Figure 4-17.

- Turn the power off to the game.**
- Remove the screws which secure the top bracket in place. (They are on its top side.)
- Remove the top bracket and slide up the attraction panel. This exposes the attraction panel light bulbs and their mounting board.
- To service the light bulbs and their mounting board:
Turn the power to the game back on so you can see which bulbs are burnt out.
Mark the burnt out bulbs and **turn the power to the game back off again.**
To replace the burnt out bulbs, grasp them gently and pull straight out.
The new bulbs are gently pushed into the empty sockets.
To completely replace the light bulb mounting board:
Open the cabinet rear access door and unplug the mounting board from its power cable.
Remove the screws that hold the mounting board to the cabinet.
Gently slide the mounting board out the front of the cabinet being careful not to catch its cable on anything.
To reinstall the above removed items, reverse this procedure.
- To replace the speaker.
Be sure the power is off to the game.
Disconnect the speaker from its cabling.
Remove the nuts and bolts securing the speaker.

Slide the speaker out through the rear access door.

To reinstall the speaker, simply reverse this procedure.

3. THE COCKTAIL TABLE MODEL HAS NO BACK-LIT ATTRACTION PANEL.

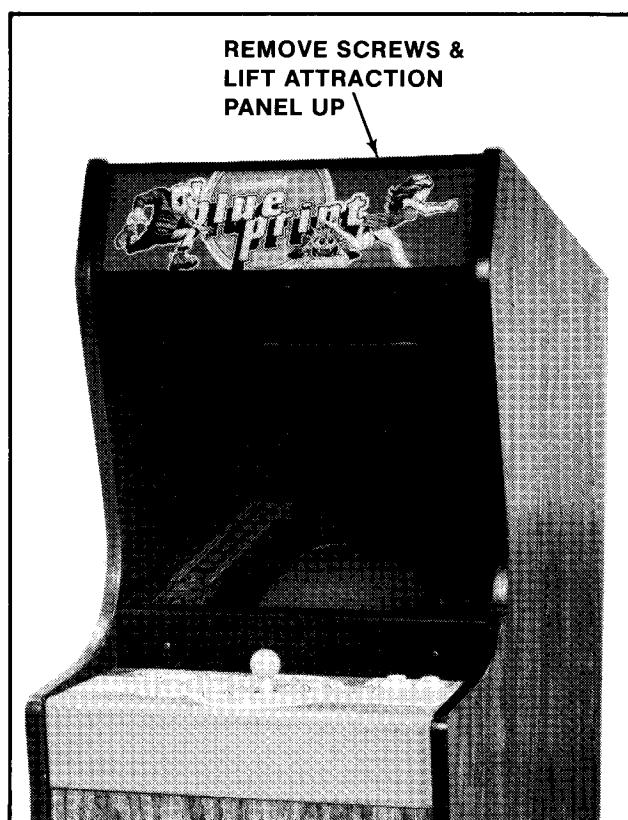

Figure 4-17 Opening the Attraction Panel — Mini

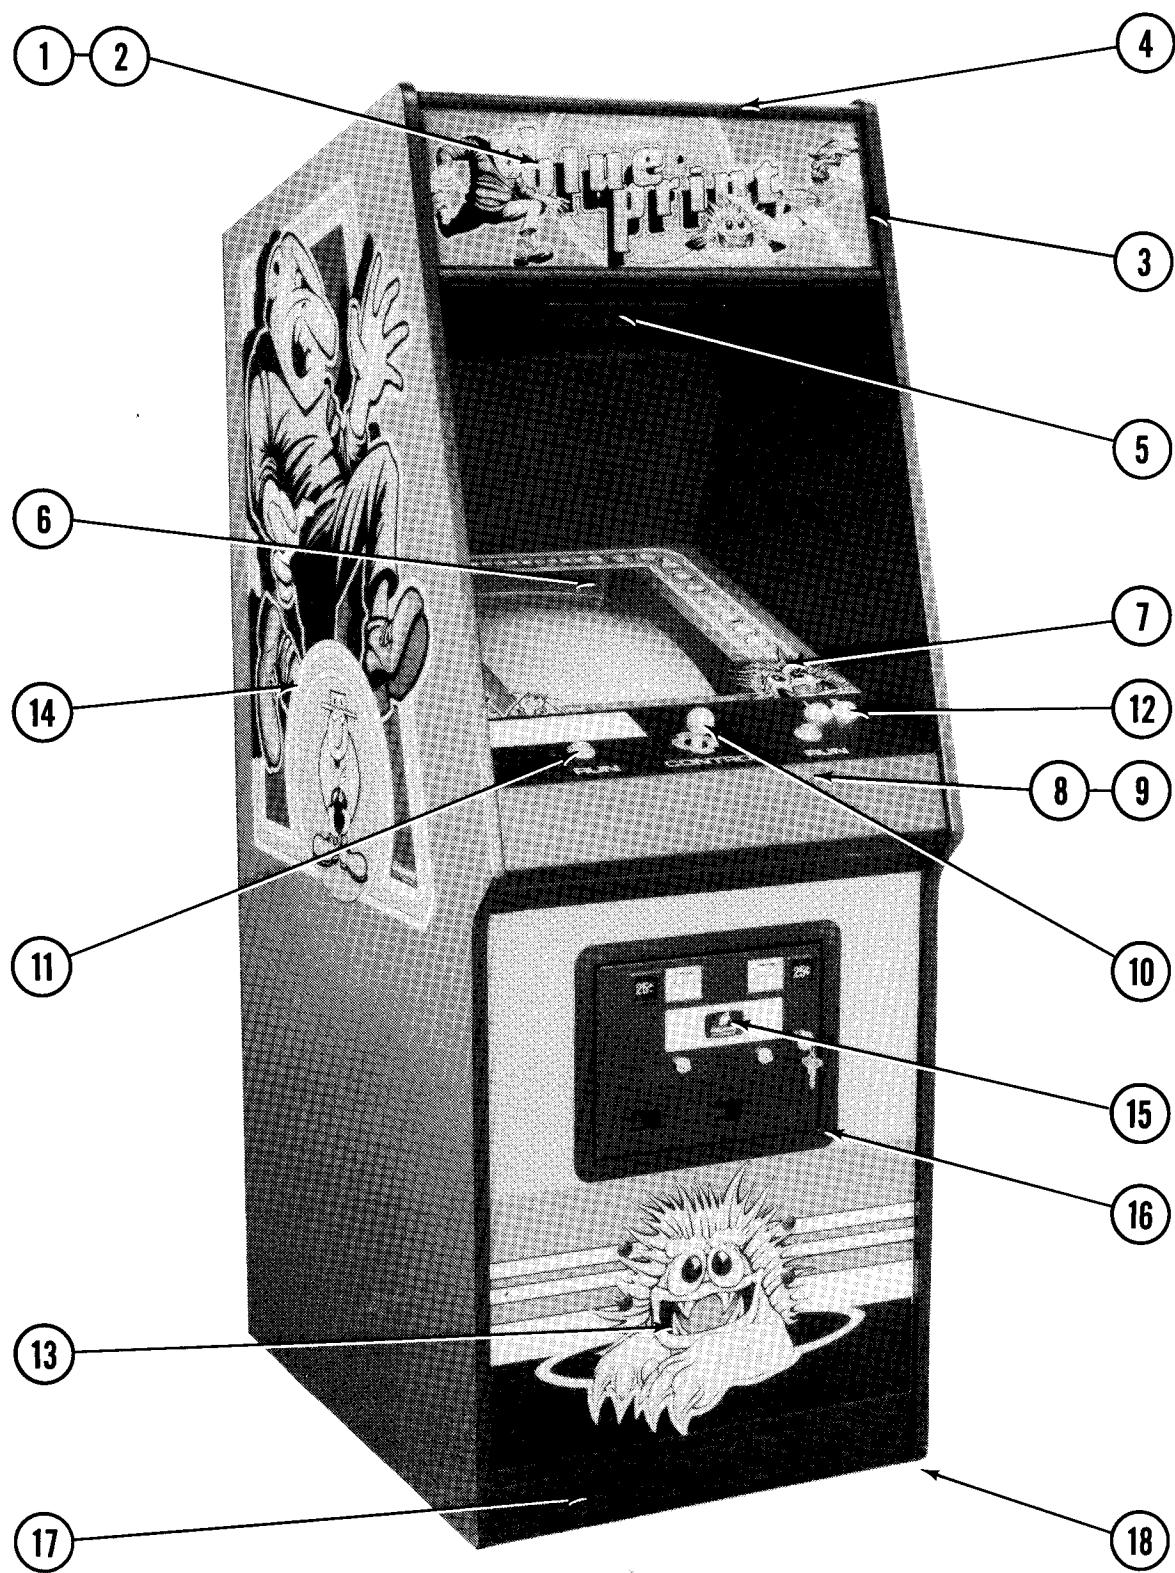

V Illustrated Parts Breakdown

BLUEPRINT — TRANSFORMER BOARD ASSEMBLY — NO PHOTOGRAPH

ORDER BY PART NUMBER ONLY

| ITEM | PART NO. | DESCRIPTION |

VI Technical Troubleshooting

Introduction

The most common problems occur in harness components such as the coin acceptor, player controls, interconnecting wiring, etc. The TV monitor and PCB computer cause their share of problems too, but not as much as the harness and its component parts. TV monitor troubleshooting will not be covered here because it is covered in that section of this manual.

As you already know, the PCB computer is a complex device with a number of different circuits. Some circuits remain basically the same among games, but overall there are a great many differences between them. PCB troubleshooting procedures, therefore, can be lengthy and will differ greatly among games. However, some basic Z-80 CPU information is involved in this section.

General Suggestions

The first step in any troubleshooting procedure is correctly identifying the malfunction's symptoms. This includes not only the circuits or features malfunctioning, but also those still operational. A carefully trained eye will pick up other clues as well. For instance, a game in which the computer functions fail completely just after money was collected may have a quarter shorting the PCB traces. Often, an experienced troubleshooter will be able to spot the cause of the problem even before opening the cabinet.

After all the clues are carefully considered, the possible malfunctioning areas can be narrowed down to one or two good suspects. Those areas can be examined by a process of elimination until the cause of the malfunction is discovered.

Harness Component Troubleshooting

Typical problems falling in this category are coin and credit problems, power problems and failure of individual features.

NO GAME CREDIT

For example, your prospective player inserts his quarter and is not awarded a game. The first item to check is if the quarter is returned. If the quarter is returned, the malfunction most certainly lies in the coin acceptor itself. First, use a set of test coins (both old and new) to ascertain that the player's coin is not undersize or underweight. If your test coins are also returned, coin acceptor servicing is indicated. Generally, the cause of this particular problem is a maladjusted magnet gate. Normally, this will mean slightly closing the magnet gate a little by turning the adjusting screw out a bit (see section on coin acceptor for more details).

If the quarter is not returned and there is no game credit, the cause of the malfunction may be in one of several areas. First try operating the coin return button; if the coin is returned, the problem is most likely in the magnet gate. Enlarge the gap according to the coin acceptor service procedures. If this does not cure the problem, remove the coin acceptor, clean it and perform the major adjustment procedure.

If the trapped coin is not returned when the wiper lever is actuated, you may have an acceptor jammed by a slug, gummed up with beer, a jammed coin chute, or mechanical failure of the acceptor mechanism. In this case, first check for the slug that will generally be trapped against the magnet. If so, simply remove the slug and test the acceptor. If the chute is blocked, remove the acceptor and remove the jammed coins. If there is actual failure of the acceptor, remove the unit and repair as indicated in the coin acceptor service procedures.

If the coin is making its way through the acceptor (that is, falling into the coin box), yet there is still no game credit, you either have a mechanical failure of the coin switch or electrical failure of the coin and credit circuits. The first place to begin is by checking the coin switch. Most of these switches are the make/break variety of micro switch, which is checked by testing for continuity between the NO, NC, and C terminals. When not actuated, the NC and C terminals should be continuous and the NO terminal open. When operated, the NO and C terminals should close and the NC should be open. If the coin switch checks out, examine the connections to the terminals to make sure there is good contact. If necessary, use the continuity tester and check from the terminal lug on the switch to the associated PCB trace. This will tell you if there is a continuous line all the way to the credit circuit.

If the coin switch wires do not check out, the problem is in the computer — most likely in the coin and credit circuitry.

If you do get game credit when a coin is deposited, but the game will not start when the start switch is pressed, you may have a problem in the start switch, the interconnecting wiring or in the computer. First check the switch. If the switch is OK, proceed to check the wiring. Again, make sure you go from the terminal lug on the switch to the PCB trace. This way, you will check the terminal contact as well as PCB edge connector contact. If the wiring is continuous, proceed to check the PCB credit circuit. If not, check each section of the wiring, until the discontinuity is located. If the wiring is OK, the problem must lie in the computer.

Transformer and Line Voltage Problems

Your machine must have the correct line voltage to operate properly. If the line voltage drops too low, a circuit in the computer will disable game credit. The point at which the computer will fail to work will vary some from game to game, but no game will work on line voltage that drops below 105 VAC.

Low line voltage may have many causes. Line voltage normally fluctuates a certain amount during the day as the total usage varies. Peak usage times occur mainly at dawn or dusk, so if your machine's malfunction seems to be related to the time of day, this may be a factor. A large load connected to the same line as the game (such as a large air conditioner or other device with an exceptionally large motor) may drop the line voltage significantly when starting up. This drop can result in an intermittent credit problem. In addition, poor connections in the location wiring, plug, or line cord may also cause a significant drop in power. Cold solder joints in the game's harness, especially in areas like the transformer connections, interlock switch, or fuse block, may also produce the same results, although probably on a more permanent basis.

Sometimes location owners (especially in bars) replace light switches with dimmer rheostats, and the game is sometimes on the same line. Obviously, the voltage available to the game is going to drop dramatically when the dimmer is turned.

In any case, the way to check for correct line voltage is with your VOM. Set the VOM to 250 VAC and stick the probes in the wall receptacle. If it's OK here, check the transformer primary connections. If you do not get 117 VAC, examine the solder joints on the transformer, fuse block, and interlock switch. If you do get 117 VAC, the problem must be either in the transformer, harness connections, or in the PCB power supply.

If you suspect the transformer, check its secondaries with the VOM set to 50 VAC and correlate the readings with the legend on the side of the transformer. The transformer must also be correctly grounded, so check the ground potential as well, especially if there is a hum bar rolling up or down the TV screen.

HARNESS PROBLEMS

Other harness problems include blowing fuses and malfunctioning controls. The repeating blown-fuse problem can sometimes be quite exasperating to solve, for short circuits have the tendency to occur in areas almost impossible to find. First, try inserting a new fuse, as old fuses age and blow without cause. If the new one also blows, you definitely have a short.

The best way to approach this problem is by turning the power off and disconnecting devices that may be causing the problem, such as the TV, transformer, and PCB. Disconnect the devices by pulling off their connectors, but do not allow them to touch. If necessary, insulate them with small pieces of electrical tape. Then, connect your VOM across the terminals of the fuse block (all electrical power shut off), and set it to one of the resistance scales. This will save blowing a fuse each time you want to check the circuit.

If the VOM reveals that disconnecting the devices removed the short, reconnect the devices one by one until the short returns. The last device connected is the one that is at fault. If the VOM reads a short even after the devices are disconnected, the fault must lie in the harness itself, and only patient exploration will reveal its location. First, carefully examine all the wiring, looking for terminals that may be touching, metal objects such as coins shorting connections or burned insulation. If necessary, use the VOM to check each suspected wire.

MALFUNCTIONING CONTROLS

One of the most common problems here is a bad potentiometer. Typically, a bad pot will cause the image to jump as it reaches a certain point. The only cure for this one is to install a new pot.

If a feature that is operated by a switch (for example, joysticks, foot pedals, control panel buttons) does not operate at all, check the switch with a VOM or continuity tester to verify its operation. If the switch does not check out, replace it. If the switch is OK, you should suspect the input to the switch from the PCB. In this case, get out the harness and logic schematics and check to see what kind of input it is. In many cases, the input will be +5 VDC. If so, use the VOM to check its presence. Normally, the switch is used to pull a +5 VDC line LOW to GND or to pull a LOW line HIGH. If the PCB output is missing, check the wire length from the PCB. If you find the signal at the PCB trace, the wire length or connection is at fault. If not, begin exploring the PCB using the logic schematics.

A Glossary of Microprocessor Terms

MICROPROCESSOR — one or several microcircuits that perform the function of a computer's CPU. Sections of the circuit have arithmetic and comparative functions that perform computations and executive instructions.

CPU — central-processing unit. A computing system's "brain", whose arithmetic, control and logic elements direct functions and perform computations. The microprocessor section of a microcomputer is on one chip or several chips.

PROM — programmable read-only memory. User permanently sets binary on-off bits in each cell by selectively fusing or not fusing electrical links. Non-erasable. Used for low-volume applications.

EPROM — erasable, programmable, read-only memory. Can be erased by ultraviolet light bath, then reprogrammed. Frequently used during design and

development to get programs debugged, then replaced by ROM for mass production.

ROM — read-only memory. The program, or binary on-off bit pattern, is set into ROM during manufacture, usually as part of the last metal layer put onto the chip. Nonerasable. Typical ROM's contain up to 16,000 bits of data to serve as the microprocessor's basic instructions.

RAM — random-access memory. Stores binary bits as electrical charges in transistor memory cells. Can be read or modified through the CPU. Stores input instructions and results. Erased when power is turned off.

LSI — large scale integration. Formation of hundreds or thousands of so-called gate circuits on semiconductor chips. Very large scale integration (VLS) involves microcircuits with the greatest component density.

MOS — metal-oxide semiconductor. A layered construction technique for integrated circuits that achieves high component densities. Variations in MOS chip structures create circuits with speed and low-power requirements, or other advantages (static will damage a MOS chip).

Introduction to the Z-80 CPU

The term "microcomputer" has been used to describe virtually every type of small computing device designed within the last few years. This term has been applied to everything from simple "microprogrammed" controllers constructed out of TTL MSI up to low end minicomputers with a portion of the CPU constructed out of TTL LSI "bit slices." However, the major impact of the LSI technology within the last few years has been with MOS LSI. With this technology, it is possible to fabricate complete and very powerful computer systems with only a few MOS LSI components.

The Zilog Z-80 family of components can be configured with any type of standard semiconductor memory to generate computer systems with an extremely wide range of capabilities. For example, as few as two LSI circuits and three standard TTL MSI packages can be combined to form a simple controller. With additional memory and I/O devices a computer can be constructed with capabilities that only a minicomputer could previously deliver.

New products using the MOS LSI microcomputer are being developed at an extraordinary rate. The Zilog Z-80 component set has been designed to fit into this market through the following factors:

1. The Z-80 is fully software compatible with the popular 8080A CPU.
2. Existing designs can be easily converted to include the Z-80.
3. The Z-80 component set is at present superior in both software and hardware capabilities to any other microcomputer system on the market today.
4. For increased throughput the Z80A operating at a 4 MHZ clock rate offers the user significant speed advantages.

Microcomputer systems are extremely simple to construct using Z-80 components. Any such system consists of three parts:

1. **CPU (Central Processing Unit)**
2. **Memory**
3. **Interface Circuits to peripheral devices**

The CPU is the heart of the system. Its function is to obtain instructions from the memory and perform the desired operations. The memory is used to contain instructions and in most cases data that is to be processed. For example, a typical instruction sequence may be to read data from a specific peripheral device, store it in a location in memory, check the parity and write it out to another peripheral device. Note that the Zilog component set includes the CPU and various general purpose I/O device controllers, while a wide range of memory devices may be used from any source. Thus, all required components can be connected together in a very simple manner with virtually no other external logic.

General Purpose Registers

There are two matched sets of general purpose registers, each set containing six 8-bit registers that may be used individually as 8-bit registers or as 16-bit register pairs by the programmer. One set is called BC, DE and HL while the complementary set is called BC', DE' and HL'. At any one time the programmer can select either set of registers to work with through a single exchange command for the entire set. In systems where fast interrupt response is required, one set of general purpose registers and an accumulator/flag register may be reserved for handling this very fast routine. Only a simple exchange command need be executed to go between the routines. This greatly reduces interrupt service time by eliminating the requirement for saving and retrieving register contents in the external stack during interrupt or subroutine processing. These general purpose registers are used for a wide range of applications by the programmer. They also simplify programming, especially in ROM based systems where little external read/write memory is available.

Arithmetic & Logic Unit (ALU)

The 8-bit arithmetic and logical instructions of the CPU are executed in the ALU. Internally the ALU communicates with the registers and the external

data bus on the internal data bus. The type of functions performed by the ALU include:

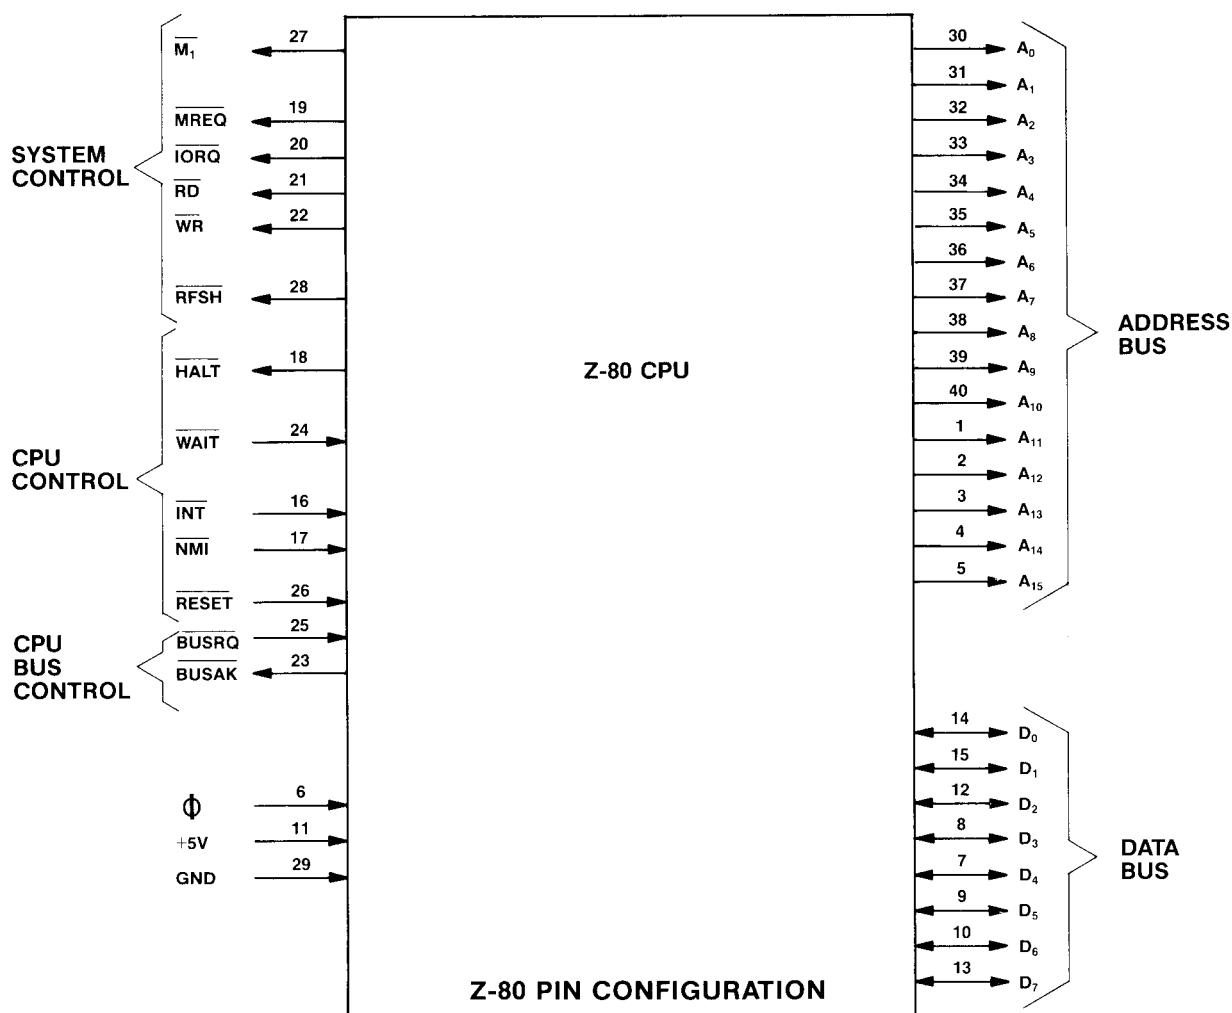

| | |
|-----------------------------|--|
| Add | Left or right shifts or rotates (arithmetic and logical) |
| Subtract | Increment |
| Logical AND | Decrement |
| Logical OR | Set bit |
| Logical Exclusive OR | Reset bit |
| Compare | Test bit |

Instruction Register and CPU Control

As each instruction is fetched from memory, it is placed in the instruction register and decoded. The control sections performs this function and then generates and supplies all of the control signals necessary to read or write data from or to the registers, control the ALU and provide all required external control signals.

Z-80 CPU Pin Description

The Z-80 CPU is packaged in an industry standard 40 pin Dual In-Line Package. The I/O pins are shown in the below figure and the function of each is described.

A₀-A₁₅ (Address Bus)

Tri-state output, active high. A₀-A₁₅ constitute a 16-bit address bus. The address bus provides the address for memory (up to 64K bytes) data exchanges and for I/O device data exchanges. I/O addressing uses the 8 lower address bits to allow the user to directly select up to 256 input or 256 output ports. A₀ is the least significant address bit. During refresh time, the lower 7 bits contain a valid refresh address.

D₀-D₇ (Data Bus)

Tri-state input/output, active high. D₀-D₇ constitute an 8-bit bidirectional data bus. The data bus is used for data exchanges with memory and I/O devices.

M₁

(Machine Cycle one)

Output, active low. M₁ indicates that the current machine cycle is the OP code fetch cycle of an instruction execution. Note that during execution of 2-byte op-codes, M₁ is generated as each op code byte is fetched. These two byte op-codes always begin with CBH, DDH, EDH or FDH. M₁ also occurs with IORQ to indicate an interrupt acknowledge cycle.

MREQ

(Memory Request)

Tri-state output, active low. The memory request signal indicates that the address bus holds a valid address for a memory read or memory write operation.

IORQ

(Input/Output Request)

Tri-state output, active low. The IORQ signal indicates that the lower half of the address bus holds a valid I/O address for a I/O read or write operation. An IORQ signal is also generated with an M₁ signal when an interrupt is being acknowledged to indicate that an interrupt response vector can be placed on the data bus. Interrupt Acknowledge operations occur during M₁ time while I/O operations never occur during M₁ time.

RD

(Memory Read)

Tri-state output, active low. RD indicates that the CPU wants to read data from memory or an I/O device. The addressed I/O device or memory should use this signal to gate data onto the CPU data bus.

WR

(Memory Write)

Tri-state output, active low. WR indicates that the CPU data bus holds valid data to be stored in the addressed memory or I/O device.

RFSH (Refresh)

Output, active low. RFSH indicates that the lower 7 bits of the address bus contain a refresh address for dynamic memories and the current MREQ signal should be used to do a refresh read to all dynamic memories.

HALT

(Halt state)

Output, active low. HALT indicates that the CPU has executed a HALT software instruction and is awaiting either a non maskable or a maskable interrupt (with the mask enabled) before operation can resume. While halted, the CPU executes NOP's to maintain memory refresh activity.

WAIT

(Wait)

Input, active low. WAIT indicates to the Z-80 CPU that the addressed memory or I/O devices are not ready for a data transfer. The CPU continues to enter wait states for as long as this signal is active. This signal allows memory or I/O devices of any speed to be synchronized to the CPU.

INT

(Interrupt Request)

Input, active low. The Interrupt Request signal is generated by I/O devices. A request will be honored at the end of the current instruction if the internal software controlled interrupt enable flip-flop (IFF) is enabled and if the BUSRQ signal is not active. When the CPU accepts the interrupt, an acknowledge signal (IORQ during M₁ time) is sent out at the beginning of the next instruction cycle. The CPU can respond to an interrupt in three different modes that are described in detail in section 5.4 (CPU Control Instructions).

NMI

(Non-Maskable Interrupt)

Input, negative edge triggered. The non maskable interrupt request line has a higher priority than INT and is always recognized at the end of the current instruction, independent of the status of the interrupt enable flip-flop. NMI automatically forces the Z-80 CPU to restart to location 0066_H. The program counter is automatically saved in the external stack so that the user can return to the program that was interrupted. Note that continuous WAIT cycles can prevent the current instruction from ending, and that a BUSRQ will override a NMI.

RESET

Input, active low. RESET forces the program counter to zero and initializes the CPU. The CPU initialization includes:

- 1) Disable the interrupt enable flip-flop

- 2) Set Register I = 00H
- 3) Set Register R = 00H
- 4) Set Interrupt Mode 0

During reset time, the address bus and data bus go to a high impedance state and all control output signals go to the inactive state.

BUSRQ

(Bus Request)

Input, active low. The bus request signal is used to request the CPU address bus, data bus and tri-state output control signals to go to a high impedance state so that other devices can control these buses. When BUSRQ is activated, the CPU will set these

buses to a high impedance state as soon as the current CPU machine cycle is terminated.

BUSAK

(Bus Acknowledge)

Output, active low. Bus acknowledge is used to indicate to the requesting device that the CPU address bus, data bus and tri-state control bus

- signals have been set to their high impedance state and the external device can now control these signals.

CLK

(Clock)

Single phase TTL level clock which requires only a 330 ohm pull-up resistor to +5 volts to meet all clock requirements.

VII. Coin Door Maintenance

SPECIAL NOTE: If you have any questions about the coin acceptors in your game(s), please feel free to contact their manufacturers. Each manufacturer's name is **PROMINENTLY** imprinted on every acceptor mechanism.

Metal mechanisms only:

COIN MECHANISMS, INC.
817 Industrial Drive
Elmhurst, IL 60126
Phone (312) 279-9150

Metal and Plastic mechanisms:

COINCO COIN ACCEPTORS, INC.
860 Eagle Drive
Bensenville, IL 60106
Phone (312) 766-6781

COIN DOOR MAINTENANCE

METAL COIN ACCEPTOR MECHANISMS

Periodically, the metal coin acceptor mechanism(s) must be removed from the coin door and cleaned.

1. **Make sure the power to the game is off.**
2. Unlock and open the coin door.

3. Remove the coin acceptor mechanism as shown in Figure 7-1.

- Push down on the two spring loaded latches.
- While holding the latches down, pull the top of the coin acceptor mechanism toward you.
- Release the latches and lift out the coin acceptor mechanism.

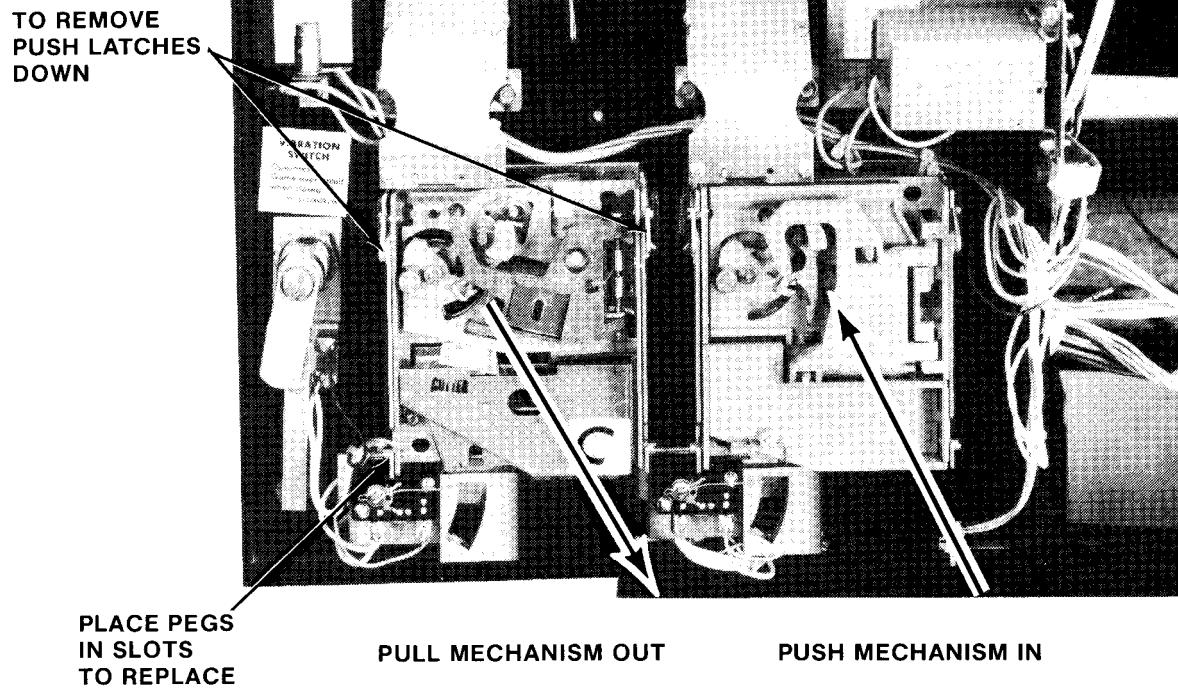

Figure 7-1 Removing and replacing coin acceptor

VII. Coin Door Maintenance

SPECIAL NOTE: If you have any questions about the coin acceptors in your game(s), please feel free to contact their manufacturers. Each manufacturer's name is **PROMINENTLY** imprinted on every acceptor mechanism.

Metal mechanisms only:

COIN MECHANISMS, INC.
817 Industrial Drive
Elmhurst, IL 60126
Phone (312) 279-9150

Metal and Plastic mechanisms:

COINCO COIN ACCEPTORS, INC.
860 Eagle Drive
Bensenville, IL 60106
Phone (312) 766-6781

COIN DOOR MAINTENANCE

METAL COIN ACCEPTOR MECHANISMS

Periodically, the metal coin acceptor mechanism(s) must be removed from the coin door and cleaned.

1. **Make sure the power to the game is off.**
2. Unlock and open the coin door.

3. Remove the coin acceptor mechanism as shown in Figure 7-1.

- Push down on the two spring loaded latches.
- While holding the latches down, pull the top of the coin acceptor mechanism toward you.
- Release the latches and lift out the coin acceptor mechanism.

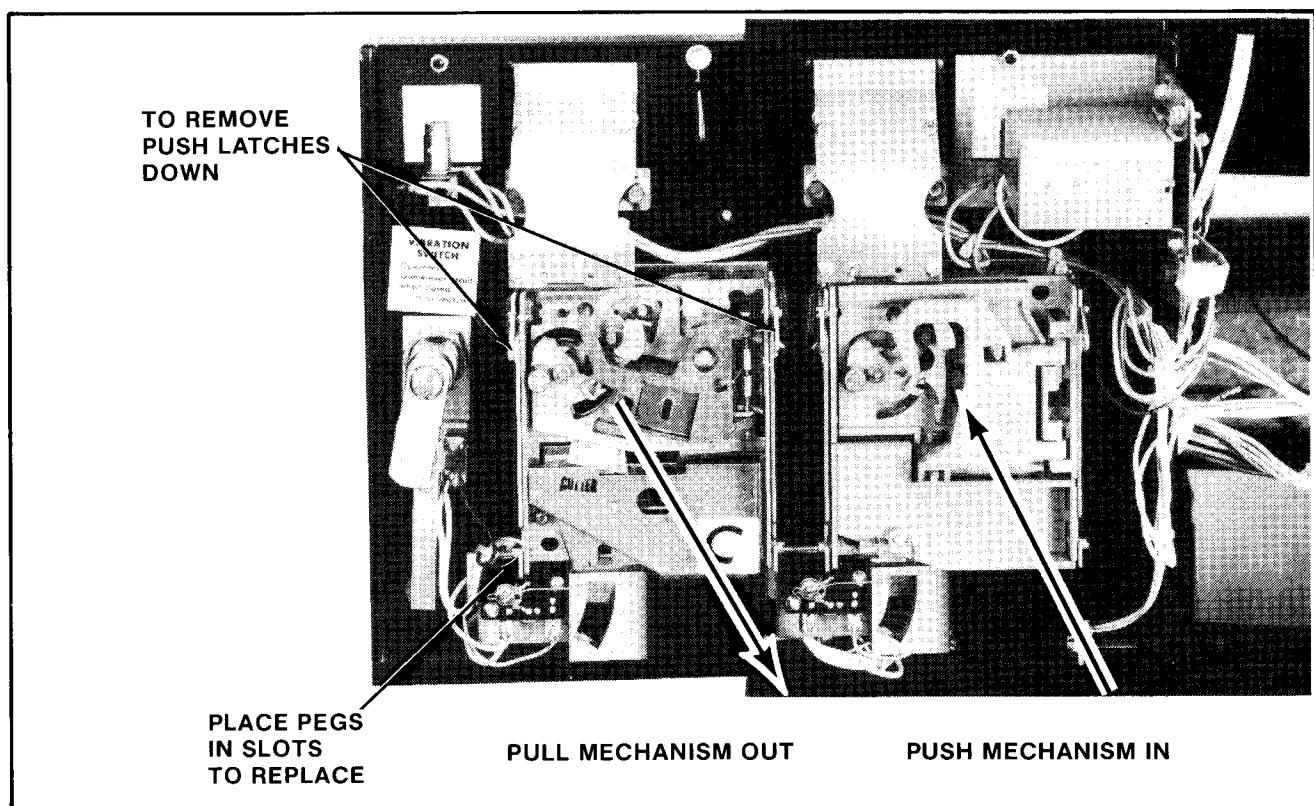

Figure 7-1 Removing and replacing coin acceptor

4. Clean the magnet of all foreign particles. See Figure 7-2.
 - This may be accomplished by swinging the gate open as shown in the above figure.
5. Remove the cradles and undersize levers and clean the bushings. (A pipe cleaner makes a good bushing cleaner.)
 - Also clean the pivot pin.
6. Whenever needed, the coin acceptor should be cleaned with hot water and cleanser in the following manner:
 - Place the coin acceptor in boiling water for about ten minutes.

CAUTION: BE CAREFUL NOT TO BURN YOURSELF.

- Next, use a brush and kitchen cleaner to remove all remaining foreign matter from the unit.
- Rinse the coin acceptor in clean boiling water.
- Dry the coin acceptor thoroughly by using filtered compressed air to blow it dry.

NOTE: The reason we recommend using boiling water is that it evaporates faster than cold water and speeds drying time.

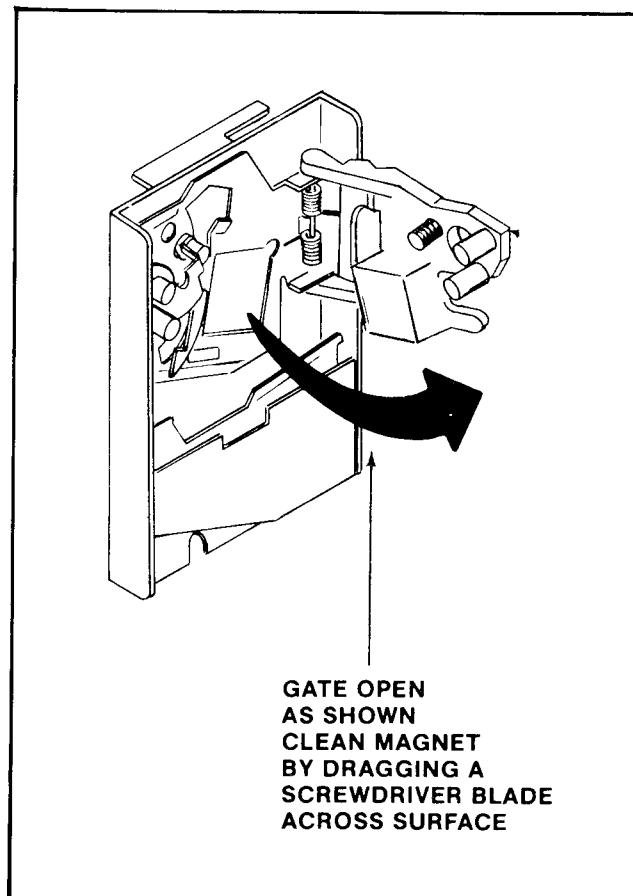

Figure 7-2 Cleaning the metal coin acceptor

7. To lubricate the coin acceptor:

- Use **ONLY** powdered graphite and put it **ONLY** on the moving parts of the coin acceptor. These parts are called out in Figure 7-3.
- Be extremely careful to keep the powdered graphite away from paths that are traveled by the coins.

— WARNING —
DO NOT USE OIL
TO LUBRICATE THE
COIN ACCEPTOR.

8. Check the coin chute for obstructions such as paper, gum, etc.
9. Reinstall the coin acceptor to the coin door. See Figure 7-1.
 - Place the two pegs at the coin acceptor's base into their retaining slots.
 - Now push the top of the coin acceptor toward the coin door until it snaps in place and is held there by the two spring loaded latches.
10. Close and lock the coin door.

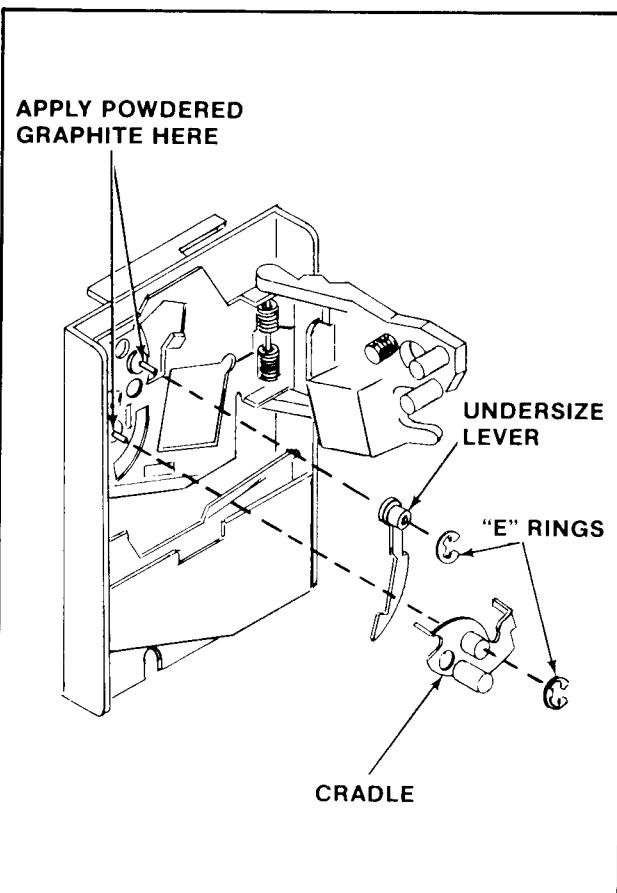

Figure 7-3 Lubricating the metal coin acceptor

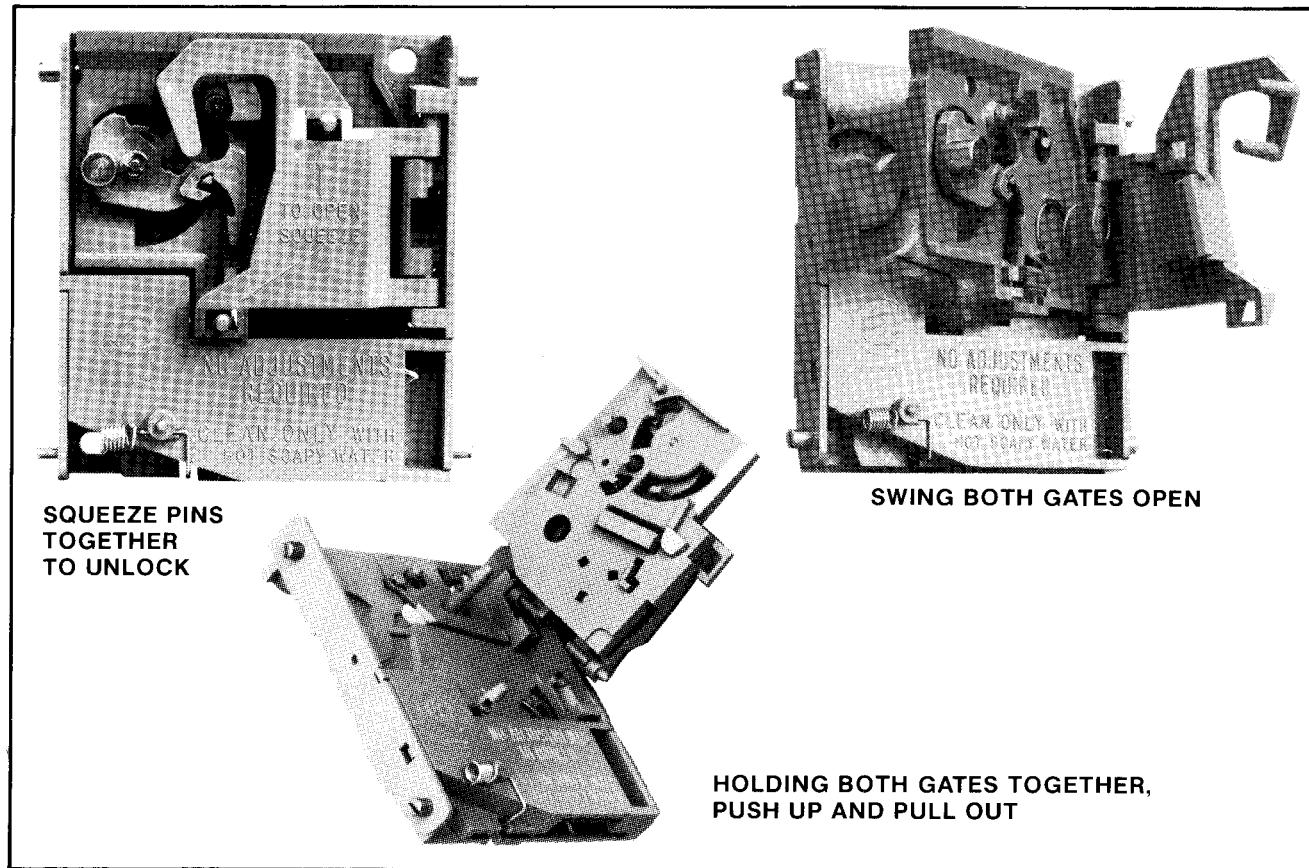

Figure 7-4 Opening the plastic coin acceptor

PLASTIC COIN ACCEPTOR MECHANISMS

The plastic coin acceptor mechanism(s) must be removed periodically from the coin door and cleaned.

1. **Make sure the power to the game is off.**
2. Unlock and open the coin door.
3. Remove the coin acceptor mechanism(s) as shown in Figure 7-1.
 - Push down on the two spring loaded latches.
 - While holding the latches down, pull the top of the acceptor mechanism toward you.
 - Release the latches and lift out the mechanism.
4. Squeeze the two pins indicated in Figure 7-4 together to open the mechanism and break it down into its three basic parts.
 - Clean the mechanism in hot soapy water. It never rusts.
 - Rinse the mechanism in clean hot water and allow it to dry.

- Reassemble the mechanism (it never needs lubrication).
- 5. Check the coin chute for obstructions such as: paper, gum, etc.
- 6. Reinstall the coin acceptor to the coin door. See Figure 7-5.
 - Place the two pegs at the coin acceptor's base into their retaining slots.
 - Now push the top of the coin acceptor toward the coin door until it snaps in place and is held there by the two spring loaded latches.
- 7. Close and lock the coin door.

NOTE: See Figure 7-6 for instructions on how to set the plastic coin acceptor mechanisms to either accept or reject Canadian quarters.

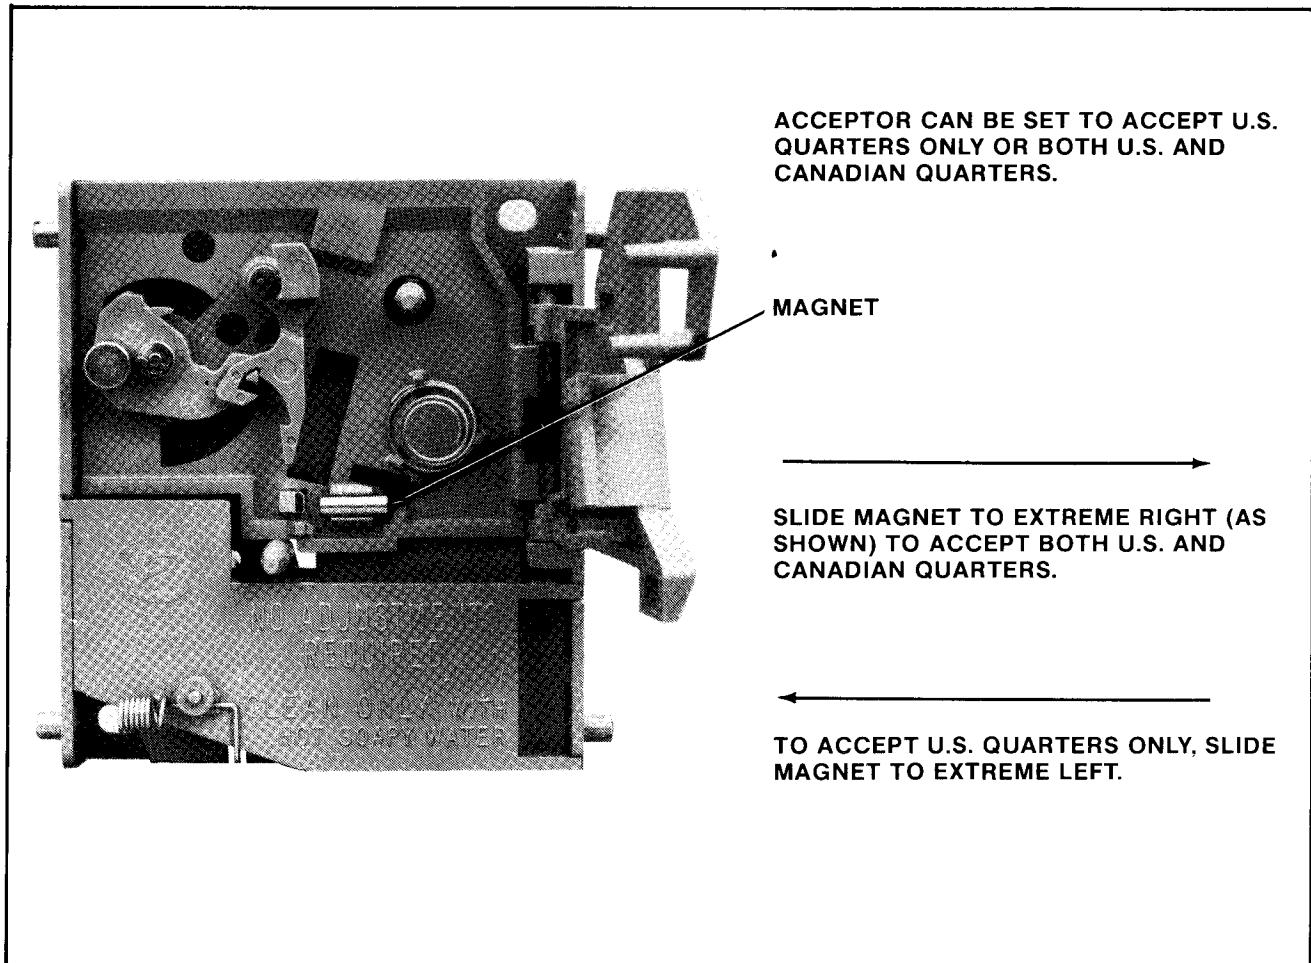

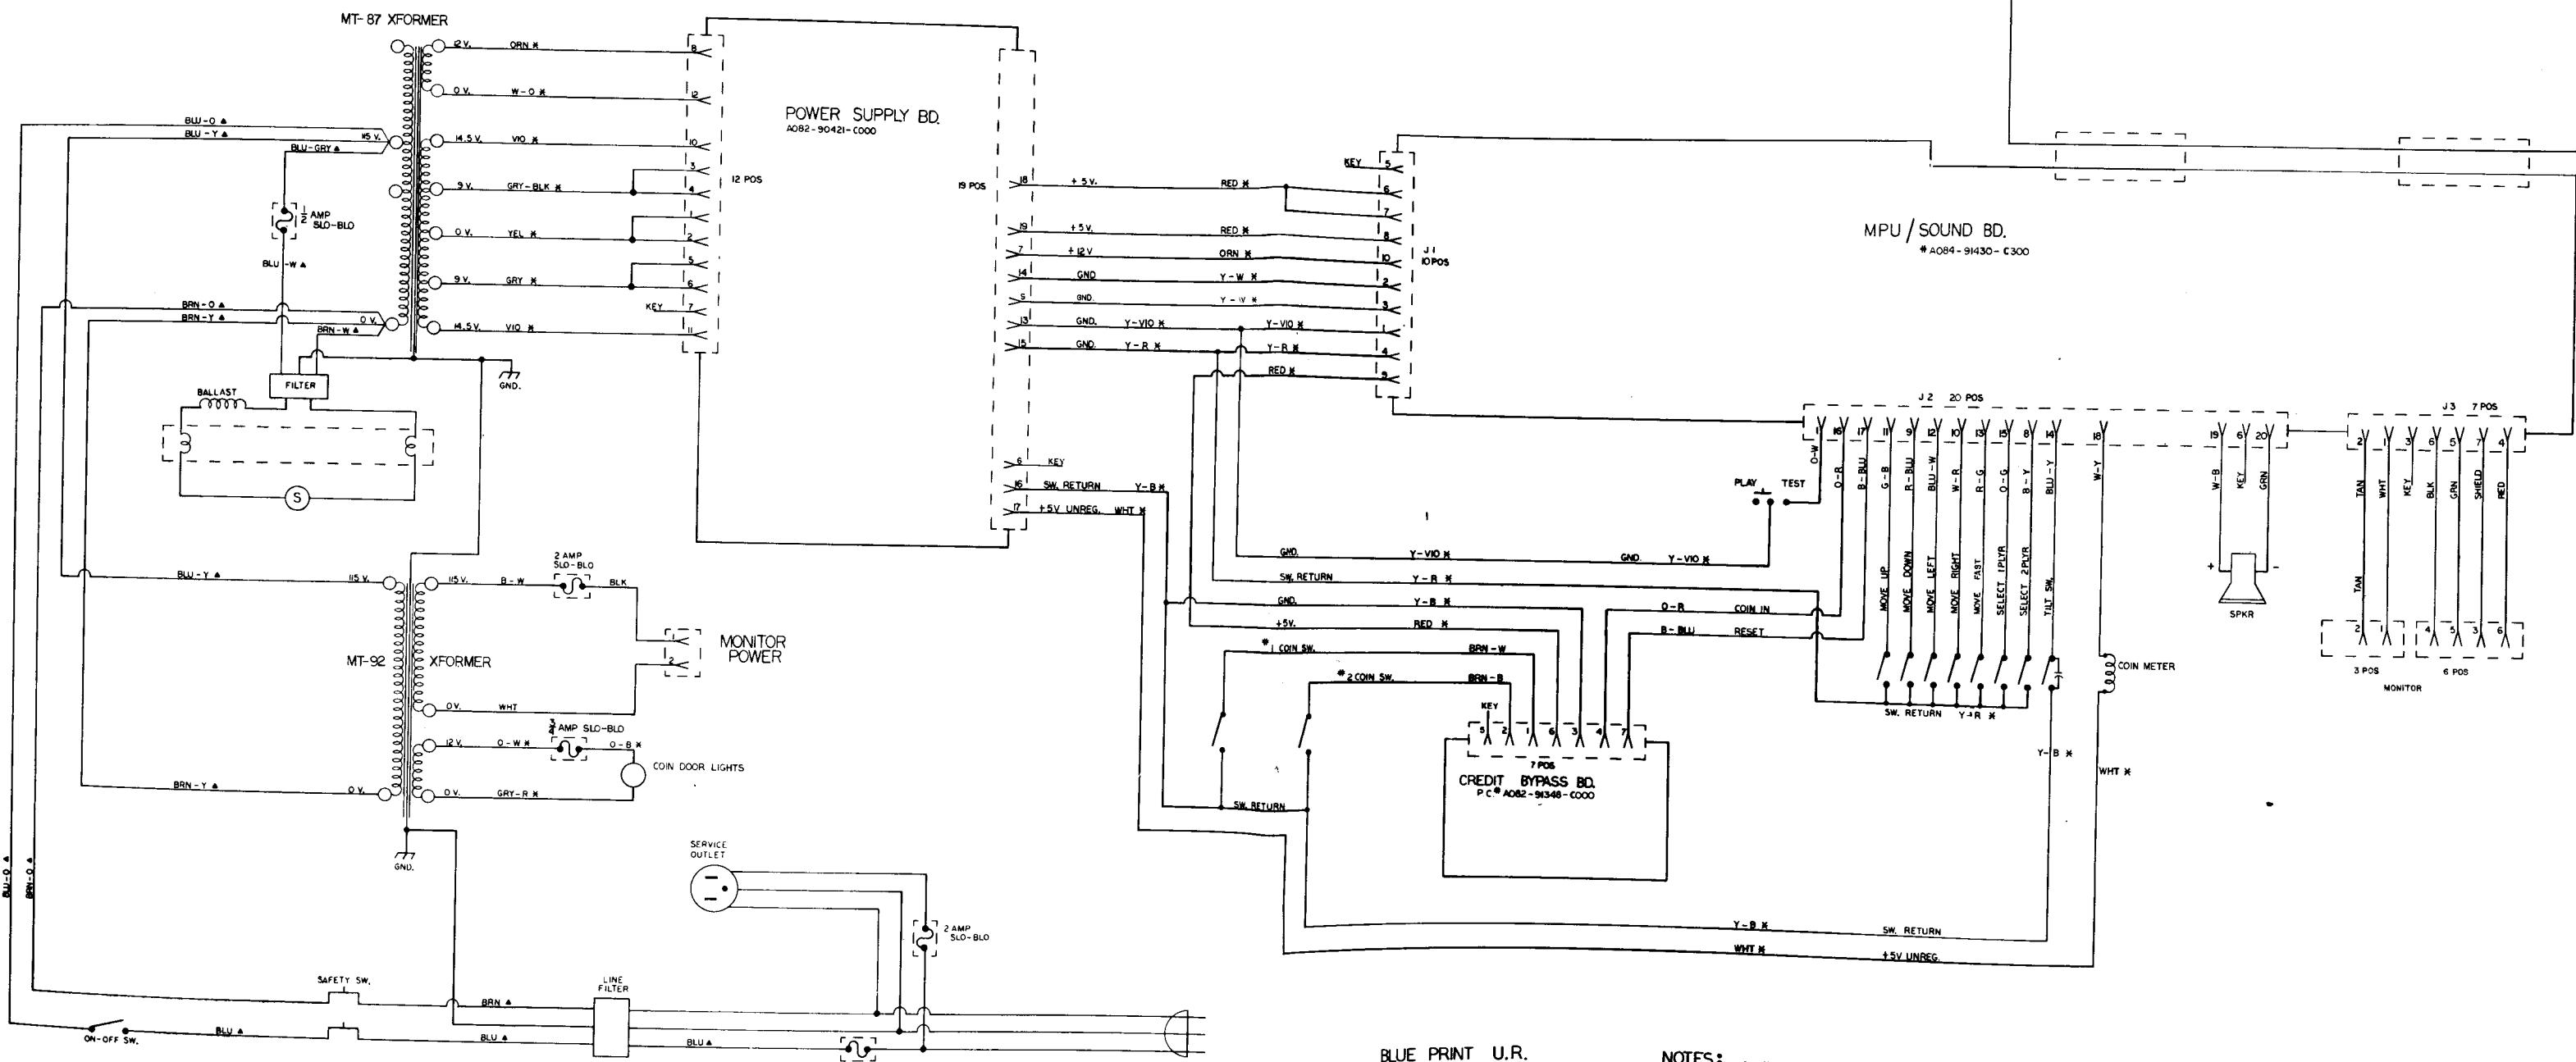

Figure 7-5 Changing the plastic coin acceptor to accept American or Canadian quarters.
